### Synchronous Presetable 4-Bit Binary Counter

TC74AC161P/F/FT Asynchronous Clear

TC74AC163P/F/FT Synchronous Clear

The TC74AC161 and 163 are advanced high speed CMOS SYNCHRONOUS PRESETTABLE COUNTERs fabricated with silicon gate and double-layer metal wiring C<sup>2</sup>MOS technology.

They achieve the high speed operation similar to equivalent Bipolar Schottky TTL while maintaining the CMOS low power dissipation.

The CK input is active on the rising edge. Both  $\overline{LOAD}$  and  $\overline{CLR}$  inputs are active on low logic level.

Presetting of these IC's is synchronous to the rising edge of CK.

The clear function of the TC74AC163 is synchronous to CK, while the TC74AC161 are cleared asynchronously.

Two enable inputs (ENP and ENT) and CARRY OUTPUT are provided to enable easy cascading of counters, which facilitates easy implementation of n-bit counters without using external gates.

All inputs are equipped with protection circuits against static discharge or transient excess voltage.

Note 1: Exceeding any of the absolute maximum ratings, even briefly, lead to deterioration in IC performance or even destruction.

Using continuously under heavy loads (e.g. the application of high temperature/current/voltage and the significant change in temperature, etc.) may cause this product to decrease in the reliability significantly even if the operating conditions (i.e. operating temperature/current/voltage, etc.) are within the absolute maximum ratings and the operating ranges.

Please design the appropriate reliability upon reviewing the Toshiba Semiconductor Reliability Handbook ("Handling Precautions"/Derating Concept and Methods) and individual reliability data (i.e. reliability test report and estimated failure rate, etc).

Note 2: 500 mW in the range of  $T_a = -40$  to  $65^{\circ}C$ . From  $T_a = 65$  to  $85^{\circ}C$  a derating factor of  $-10$  mW/ $^{\circ}C$  should be applied up to 300 mW.

**Operating Ranges (Note)**

Input capacitance	$C_{\text{IN}}$	—	—	5	10	—	10	pF	
Power dissipation capacitance	$C_{\text{PD}}$	(Note 2)	—	85	—	—	—	pF	

Note 1: For TC74AC161 only

Note 2:  $C_{\text{PD}}$  is defined as the value of the internal equivalent capacitance which is calculated from the operating current consumption without load.

Average operating current can be obtained by the equation:

$$I_{\text{CC (opr)}} = C_{\text{PD}} \cdot V_{\text{CC}} \cdot f_{\text{IN}} + I_{\text{CC}}$$

When the outputs drive a capacitive load, total current consumption is the sum of  $C_{\text{PD}}$ , and  $\Delta I_{\text{CC}}$  which is obtained from the following formula:

$$\Delta I_{\text{CC}} = f_{\text{CK}} \cdot V_{\text{CC}} \left( \frac{C_{\text{QA}}}{2} + \frac{C_{\text{QB}}}{4} + \frac{C_{\text{QC}}}{8} + \frac{C_{\text{QD}}}{16} + \frac{C_{\text{CO}}}{16} \right)$$

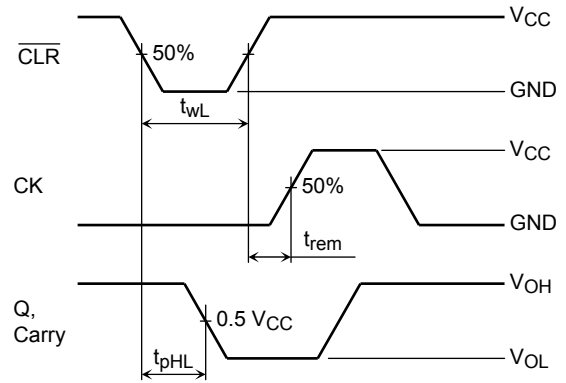

$C_{\text{QA}}$  to  $C_{\text{QD}}$  and  $C_{\text{CO}}$  are the capacitances at QA to QD and CARRY OUT, respectively.

$f_{\text{CK}}$  is the input frequency of the CK.
