#### Description

The HMMC-5618 66 to 20 GHz MMIC is an efficient two-stage medium-power amplifier that is designed to be used as a cascadable intermediate gain block for EW applications. In communication systems, it can be used as an amplifier for a local oscillator or as a transmit amplifier. It is fabricated using a PHEMT integrated circuit structure that provides exceptional efficiency and flat gain performance. During typical operation, with a single 5-volt DC power supply, each gain stage is biased for Class-A operation for optimal power output with minimal distortion. The RF input and RF output has matching circuitry for use in 50  $\Omega$  environments.

The backside of the chip is both RF and DC ground. This helps simplify the assembly process and reduces assembly related performance variations and costs.

#### Absolute maximum ratings<sup>1</sup>

Symbol	Parameters/conditions	Minimum	Maximum	Units

$T_{\text{ch}}$	Channel temperature <sup>4</sup> ( $T_A = 100^\circ\text{C}$ , MTTF > $10^6$ hrs, $V_{D1} = V_{D2} = 5\text{ V}$ , $V_{G1} = V_{G2} = \text{open}$ )		150		$^\circ\text{C}$

1 Backside ambient operating temperature  $T_A = 25^\circ\text{C}$  unless otherwise noted.

2 The specified FET stage is in the OFF state when biased with a gate voltage level that is sufficient to pinch off the drain current.

3 Thermal resistance (in  $^\circ\text{C}/\text{Watt}$ ) at a channel temperature  $T(^\circ\text{C})$  can be *estimated* using the equation:  $\theta(T) \cong_{87} \times [T(^\circ\text{C})+273] / [150\text{ }^\circ\text{C}+273]$ .

4 Derate MTTF by a factor of two for every  $8^\circ\text{C}$  above  $T_{\text{ch}}$ .

### Applications

The HMMC-5618 is a GaAs MMIC medium-power amplifier designed for optimum Class-A efficiency and flat gain performance from 6 GHz to 20 GHz. It has applications as a cascadable gain stage for EW amplifier, buffer stages, LO-port driver, phased-array radar, and transmitter amplifiers used in commercial communication systems. The MMIC solution is a cost effective alternative to hybrid assemblies.

### Biasing and operation

The MMIC amplifier is normally biased with a single positive drain supply connected to both  $V_{D1}$  and  $V_{D2}$  bond pads as shown in Figures 10 and 11. The recommended drain supply voltage is 3 to 5 volts. If desired, the first stage drain bonding pad can be biased separately to provide a small amount of gain slope control or bandwidth extension as demonstrated in Figure 2.

No ground wires are required because all ground connections are made with plated through-holes to the backside of the device.

Gate bias pads ( $V_{G1}$  and  $V_{G2}$ ) are also provided to allow adjustments in gain, RF output power, and DC power dissipation, if necessary. No connection to the gate pads is needed for single drain-bias operation. However, for custom applications, the DC current flowing through the input and/or output gain stage may be adjusted by applying a voltage to the gate bias pad(s) as shown in Figure 11. A negative gate-pad voltage will decrease the drain current. The gate-pad voltage is approximately zero volts during operation with no DC gate supply. Refer to the "Absolute maximum ratings" table for allowed DC and thermal conditions.

### Assembly techniques

It is recommended that the RF input, RF output, and DC supply connections be made using 0.7 mil diameter gold wire. The device has been designed so that optimum performance is realized when the RF input and RF output bond-wire inductance is approximately 0.2 nH (10 mils) as demonstrated in Figures 4, 6, and 7.

GaAs MMICs are ESD sensitive. ESD preventive measures must be employed in all aspects of storage, handling, and assembly.

MMIC ESD precautions, handling considerations, die attach and bonding methods are critical factors in successful GaAs MMIC performance and reliability.

Agilent application note #54, "GaAs MMIC ESD, Die Attach and Bonding Guidelines" provides basic information on these subjects.
