

# 7.5V to 15V, 3A 1ch Synchronous Buck Converter

## BD95831MUV

### ●Description

BD95831MUV is a 1ch synchronous buck converter that can generate output voltage (0.8V to 5.5V) at the input voltage range (7.5V to 15V). Space-saving and high efficient switching regulator can be achieved due to built-in N-MOSFET power transistors. The IC also incorporates H<sup>3</sup>Reg™ technology, a Rohm proprietary constant ONTIME control mode which facilitates ultra-high transient response against changes in load without external compensation components. Fixed soft start function, power good function, and short circuit / over voltage protection with timer latch functions are incorporated. The BD95831MUV is designed for power supplies for Digital AV Equipment.

### ●Applications

- LCD TVs
- Set Top Boxes (STB)
- DVD/Blue-ray players/recorders
- Broadband Network and Communication Interface
- Amusement, other.

### ●Features

- Input Voltage Range: 7.5V ~ 15.0V
- Reference Voltage: 0.8V ± 1.5%
- Output Voltage Range: 0.8V ~ 5.5V
- Output Current: 3.0A (Max.)
- Switching Frequency: 500kHz ~ 800kHz  
(depend on input-output condition)
- Built-in Power MOS FET
  - High-side Nch FET ON resistance: 85mΩ (typ.)
  - Low-side Nch FET ON resistance: 55mΩ (typ.)
- Fast Transient Responses due to H<sup>3</sup>Reg control
- Over Current Protection (OCP) – Cycle-by-Cycle
- Thermal Shut Down (TSD)
- Under-Voltage Lock-Out (UVLO)
- Short Circuit Protection (SCP)
- Over Voltage Protection (OVP)
- Fixed Soft Start (1msec ; typ)
- Power Good function

### ●Package

- VQFN016V3030

W(Typ.) x D(Typ.) x H(Max.)

3.0mm x 3.0mm x 1.0mm

### ●Typical Application

Fig.1 Typical Application Circuit

### ●Pin Configuration (TOP VIEW)

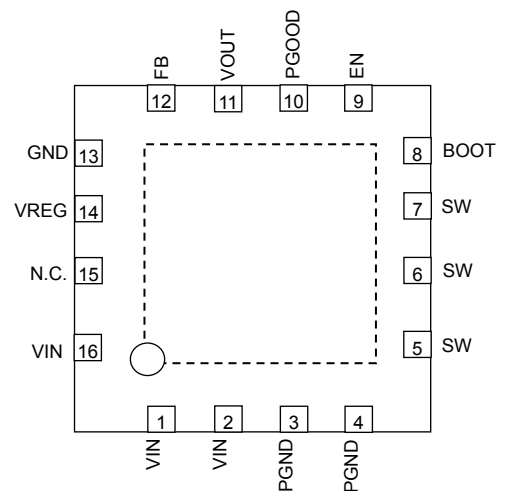

Fig.2 Pin Configuration

## ●Pin Description (Continued)

No.	Symbol	Description
11	VOUT	Output Voltage Sense pin. Connect to output voltage directly. ONTIME is determined by monitoring the output voltage.
12	FB	Output Voltage Feedback pin. FB is compared with REF in the IC. Please set the output voltage in the feedback resistances of less than total 50k $\Omega$ . (Refer to 15 page)
13	GND	Sense GND pin for all internal analog and digital power supplies.
14	VREG	Power supply output inside IC. When at least 2.2V is supplied to the EN pin, the VREG is active. This pin supplies 5.0V at up to 10mA. Insert a 22000pF capacitor between this pin and GND pin.
15	N.C.	No Connect Pin. Connect to GND.
Thermal Pad	-	Exposed Thermal Pad. Connect to GND.

## ● Absolute Maximum Ratings (Ta=25°C)

Parameter	Symbol	Limit	Unit	Comment
Input Voltage	VIN	15.2 *1	V	
BOOT Voltage	BOOT	21.5 *1	V	
BOOT-SW Voltage	BOOT-SW	7 *1	V	
Output Voltage	VOUT	7 *1	V	
SW Voltage	SW	15.2 *1	V	
Output Feedback Voltage	FB	VREG	V	
VREG Voltage	VREG	7 *1	V	
EN Input Voltage	EN	15.2 *1	V	
PGOOD Voltage	PGOOD	7 *1	V	
Power Dissipation 1	Pd1	0.27	W	Ta ≥ 25°C (IC only), power dissipated at 2.2mW / °C.
Power Dissipation 2	Pd2	0.62	W	Ta ≥ 25°C (70mm×70mm×1.6mm single-layer board, 6.28mm <sup>2</sup> copper heat dissipation pad), power dissipated at 5.0mW / °C.
Power Dissipation 3	Pd3	1.77	W	Ta ≥ 25°C (70mm × 70mm × 1.6mm 4-layer board, 6.28 mm <sup>2</sup> copper heat dissipation pad on top and bottom layer, 5505 mm <sup>2</sup> pad on 2 <sup>nd</sup> and 3 <sup>rd</sup> layer), power dissipated at 14.1mW / °C.
Power Dissipation 4	Pd4	2.66	W	Ta ≥ 25°C (70mm × 70mm × 1.6mm 4-layer board, all layers with 5505 mm <sup>2</sup> copper heat dissipation pads), power dissipated at 21.3mW / °C.
Operating Temperature Range	Topr	-20~+100 *1	°C	
Storage Temperature Range	Tstg	-55~+150	°C	
Junction Temperature	Tjmax	+150	°C	

\*1 Not to exceed Pd.

## ● Operating Ratings (Ta= -20 ~ 100°C)

Parameter	Symbol	Limit			Unit
		Min	Typ	Max	
Input Voltage	VIN	7.5	12	15	V
VREG Voltage	VREG	4.5	5.0	5.5	V
BOOT Voltage	BOOT	4.5	-	21	V
SW Voltage	SW	-0.7	-	15	V
BOOT-SW Voltage	BOOT-SW	4.5	-	5.5	V
EN Input Voltage	EN	0	-	15	V
Output Voltage	VOUT *2	0.8	-	5.5	V
PGOOD Voltage	PGOOD	0	-	5.5	V
MIN ON Time	Tonmin	-	-	200	nsec

\*2 VOUT depends on Input Voltage (VIN) in some cases.

## ●Electrical Characteristics

(Unless otherwise noted Ta=25°C, VIN=12V, EN=3V, VOUT=3.3V)

Parameter	Symbol	Limit			Unit	Condition
		Min	Typ	Max

●Explanation of Operation

The BD95831MUV is a 1ch synchronous buck converter incorporating ROHM's proprietary H<sup>3</sup>Reg™ CONTROLLA system. When VOUT drops due to a rapid load change, the system quickly restores VOUT by increasing the frequency.

1. H<sup>3</sup>Reg™ System

1-1. Normal Operation

When FB falls below the threshold voltage (REF), a drop is detected, activating the H<sup>3</sup>Reg™ CONTROLLA system.

$$T_{on} = \frac{V_{OUT}}{V_{IN}} \times \frac{1}{f} \quad [\text{sec}] \quad (1)$$

HG (Gate of High side MOSFET) output is determined by the formula (1). LG (Gate of Low side MOSFET) output operates until FB voltage falls below REF voltage after HG becomes OFF. OFF time is restricted by MIN OFF Time (typ.:450nsec). Hence, BD95831MUV runs with a constant on-time by using the input and output voltage to set the internal on-time timer.

1-2. VOUT drops due to a rapid load change

When FB (VOUT) drops due to a rapid load change and the voltage remains below REF, the system quickly restores VOUT by shortening OFF time of HG (increasing the frequency), improving transient response as shown Fig. 16 (b).

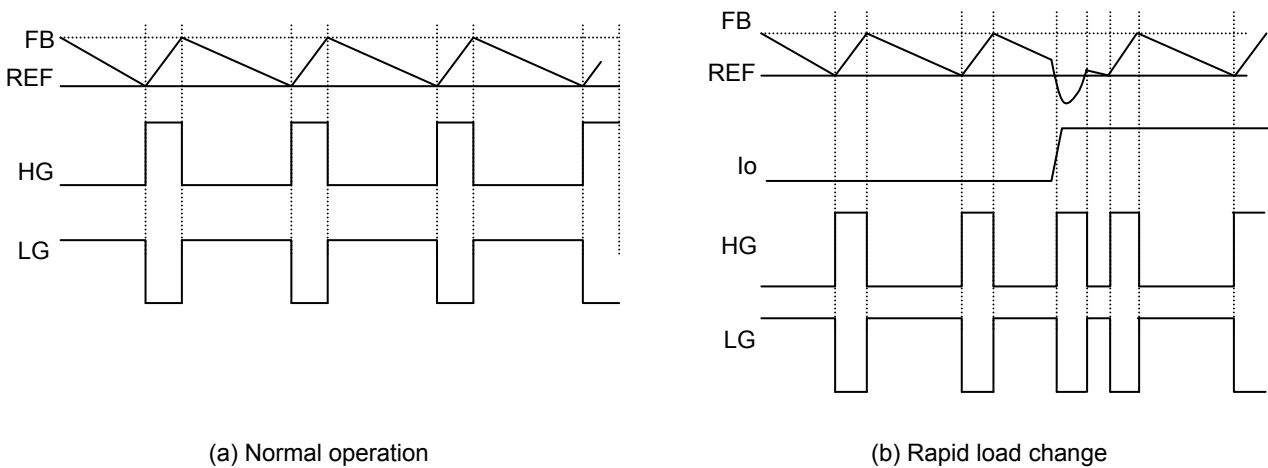

Fig.16 H<sup>3</sup>REG System

●Timing Chart

1. Soft Start Function

Soft start is utilized when the EN pin is set high. Current control takes effect at startup, enabling a moderate “ramping start” on the output voltage. Soft start time is 1.0msec (typ). Rush current is determined via formula (2) below.

$$I_{IN} = \frac{C_{OUT} \times V_{OUT}}{1.0msec} \quad [A] \quad (2)$$

C<sub>OUT</sub>: All capacitors connected with V<sub>OUT</sub>

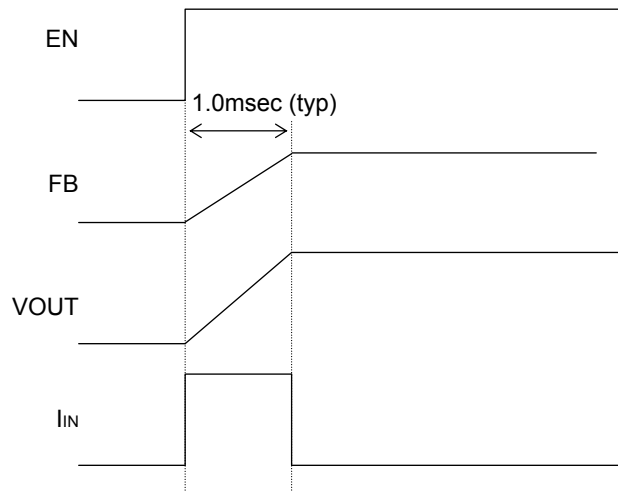

Fig.17 Soft Start Timing Chart

2. Power Good Function

When FB voltage is more than 0.72V (90%), the integrated open-drain NMOS is set to OFF, and PGOOD outputs High due to pull-up register. If FB voltage falls below 0.68V (85%), PGOOD becomes Low.

Fig.18 Power Good Timing Chart

## ●Protection Operation

### 1. OCP Operation

Normally, when FB voltage falls below REF voltage, HG becomes high. However, if the current through the inductor ( $I_L$ ) exceeds OCP current value ( $I_{OCP}$ ) during LG=ON, HG does not become high and  $I_L$  is restricted by  $I_{OCP}$ . When  $I_L$  falls down below  $I_{OCP}$ , HG is stricken by the pulse width of  $T_{on}$  decided by formula (1). As the result, the output voltage can decrease as the frequency and duty are changed.

When OCP is released in the state that the output has decreased by OCP operation, the output voltage might rise up due to high-speed load response. Also OFF Latch is operated when FB voltage becomes below the SCP setting voltage during 1msec (typ.) (Refer to 2-1).

Fig.19 OCP Timing Chart

### 2. SCP Operation / OVP Operation (OFF Latch)

#### 2-1. SCP Operation

SCP monitors FB voltage. When FB falls below 0.56V, after 1msec (typ.) later, the short circuit protection (SCP) operates, turning the high side MOSFET and low side MOSFET OFF, and performs OFF latch operation.

#### 2-2. OVP Operation

OVP monitors FB voltage. When FB exceeds 0.96V, after 1msec (typ.) later, the output over voltage protection (OVP) operates, turning the high side FET OFF and the low side FET ON, and performs OFF latch operation.

#### 2-3. Recovery from OFF Latch mode

Off latch is released by EN=OFF or UVLO operation, and then it returns to standard operation.

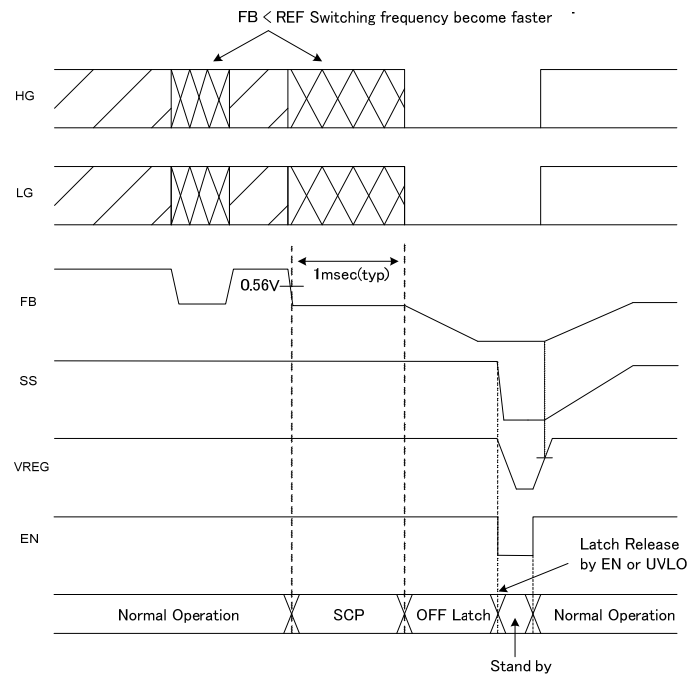

Fig.20 SCP Timing Chart

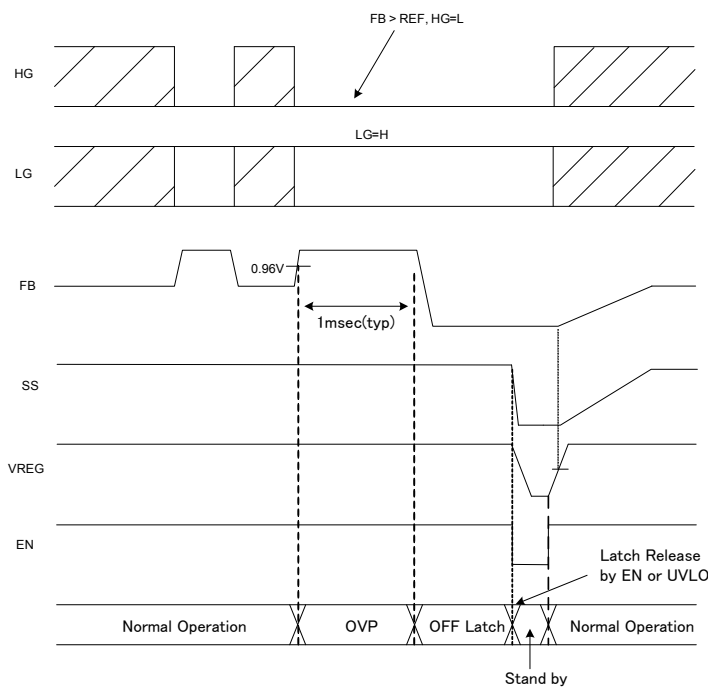

Fig.21 OVP Timing Chart

**3. TSD Operation (Self Recovery)**

TSD is self-activating. If the junction temperature exceeds  $T_j = 175^\circ\text{C}$ , and HG, LG, PGOOD, and SS become Low. The IC becomes standby when TSD operating. When  $T_j$  falls below  $150^\circ\text{C}$ , it returns to standard operation.

**4. UVLO Operation**

UVLO operates when VREG voltage falls below 4.05V, and HG, LG, PGOOD and SS become Low. The IC becomes standby when UVLO operating. UVLO is released when VREG goes up to 4.2V, and starts standard operation

● Selection of Components Externally Connected

1. Output LC Filter Selection (Buck Converter)

1-1. Inductor (L) Selection

The Output LC filter is required to supply constant current to the output load. A larger value inductance at this filter results in less inductor ripple current ( $\Delta I_L$ ) and less output ripple voltage. However, the larger value inductors tend to have less fast load transient-response, a larger physical size, a lower saturation current and higher series resistance. A smaller value inductance has almost opposite characteristics above.

The value of  $\Delta I_L$  is shown as formula (3). The larger value of the inductance or the faster switching frequency make the lower ripple voltage.

$$\Delta I_L = \frac{(V_{IN} - V_{OUT}) \times V_{OUT}}{L \times f \times V_{IN}} \quad [A] \quad (3)$$

The proper output ripple current setting is about 30% of maximum output current.

$$\Delta I_L = 0.3 \times I_{OUTMAX} \quad [A] \quad (4)$$

$$L = \frac{(V_{IN} - V_{OUT}) \times V_{OUT}}{\Delta I_L \times f \times V_{IN}} \quad [H] \quad (5)$$

( $\Delta I_L$  : output ripple current、 $f$  : switching frequency)

※A larger current than the inductor’s rated current will cause magnetic saturation in the inductor, and decrease efficiency.

When selecting an inductor, be sure to allow enough margins to assure that peak current does not exceed the inductor’s rated current value.

※To minimize loss of inductor and improve efficiency, choose a inductor with a low resistance (DCR, ACR).

Fig.22 Inductor Ripple Current

1-2. Output Capacitor (C<sub>OUT</sub>) Selection

Output Capacitor (C<sub>OUT</sub>) has a considerable influence on output voltage regulation due to a rapid load change and smoothing output ripple voltage. Determine the capacitor by considering the value of capacity, the equivalent series resistance, and equivalent series inductance. Also, make sure the capacitor’s voltage rating is high enough for the set output voltage (including ripple).

Output ripple voltage is determined as in formula (6) below.

$$\Delta V_{OUT} = \Delta I_L / (8 \times C_{OUT} \times f) + ESR \times \Delta I_L + ESL \times \Delta I_L / T_{on} \quad [V] \quad (6)$$

( $\Delta I_L$  Output ripple current、ESR: Equivalent series resistance、ESL: Equivalent series inductance)

Also, give consideration to the conditions in formula (7) below for output capacitance, bearing in mind that output rise time must be established within the fixed soft start time. As output capacitance, bypass capacitor will be also connected to output load side (C<sub>EXT</sub>, Fig.23). Please set the over current detection value with regards to these capacitance.

$$C_{OUT} \leq \frac{1\text{msec} \times (I_{OCP} - I_{OUT})}{V_{OUT}} \quad [F] \quad (7)$$

(I<sub>OCP</sub> : OCP Current Limit, I<sub>OUT</sub> : Output Current)

Note: an improper output capacitor may cause startup malfunctions.

Fig.23 Output Capacitor

2. Input Capacitor (CIN) Selection

Fig.24 Input Capacitor

In order to prevent transient spikes in voltage, the input capacitor should have a low enough ESR resistance to fully support a large ripple current. The formula for ripple current I<sub>RMS</sub> is given in equation (8) as below.

$$I_{RMS} = I_{OUT} \times \frac{\sqrt{V_{OUT} \times (V_{IN} - V_{OUT})}}{V_{IN}} \quad [A] \quad (8)$$

Where  $V_{IN} = 2 \times V_{OUT}$ ,  $I_{RMS} = \frac{I_{OUT}}{2}$

A low ESR capacitor is recommended to reduce ESR loss and improve efficiency.

3. Output Voltage Setting

The IC controls output voltage as  $REF \doteq V_{FB}$ .

However, the actual output voltage will also reflect the average ripple voltage value.

The output voltage is set with a resistor divider from the output node to the FB pin. The formula for output voltage is given in (9) below:

$$\text{Output Voltage} = \frac{R1+R2}{R2} \times REF + \Delta V_{OUT} \quad [V] \quad (9)$$

$$REF = V_{FB(TYP)} (0.8V) + 0.02 - (ON DUTY \times 0.05) \quad [V] \quad (10)$$

$$ON DUTY = \frac{V_{OUT}}{V_{IN}} \quad (11)$$

Please refer to eq. (6) regarding  $\Delta V_{OUT}$ .

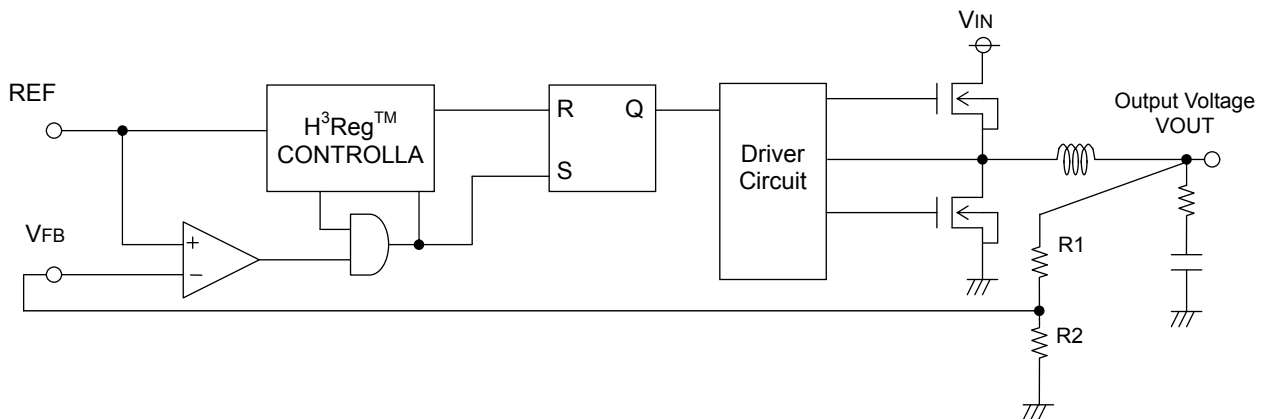

Fig.25 Output Voltage Setting

#### 4. Relationship between Output Voltage and ONTIME

BD95831MUV is a synchronous buck converter controlling constant ONTIME. The ONTIME (Ton) depends on the output voltage settings, as described by the formula (12).

$$T_{on} = 1770 \times \frac{V_{OUT}}{V_{IN}} - \frac{610}{V_{IN}} + 55 \quad [\text{nec}] \quad (12)$$

The frequency of the application condition is determined by the formula (13) using the above Ton.

$$\text{Frequency} = \frac{V_{OUT}}{V_{IN}} \times \frac{1}{T_{on}} \quad [\text{kHz}] \quad (13)$$

However with actual applications, there exists a rising and falling time of the SW due to the gate capacitance of the integrated MOSFET and the switching speed, which may vary the above parameters. Therefore please also verify those parameters experimentally.

#### 5. Relationship between Output Current and Frequency

BD95831MUV is a constant ontime type of switching regulator. When the output current increases, the switching loss of the inductor, MOSFET, and output capacitor also increases. Hence the switching frequency speeds up. The loss of the inductor, MOSFET, and output capacitor is determined as below.

- ① Loss of Inductor =  $I_{OUT}^2 \times DCR$
- ② Loss of MOSFET (High Side) =  $I_{OUT}^2 \times R_{ONH} \times \frac{V_{OUT}}{V_{IN}}$
- ③ Loss of MOSFET (Low Side) =  $I_{OUT}^2 \times R_{ONL} \times (1 - \frac{V_{OUT}}{V_{IN}})$
- ④ Loss of Output Capacitor =  $I_{OUT}^2 \times ESR$

(DCR : Inductor Equivalent series resistance、 $R_{ONH}$  : On resistance of High-side MOSFET、 $R_{ONL}$  : On resistance of Low-side MOSFET、ESR :COUT Equivalent series resistance)

Taking the above losses into the frequency equation, then T (=1/Freq) becomes

$$T (=1/\text{Freq}) = \frac{V_{IN} \times I_{OUT} \times T_{on}}{V_{OUT} \times I_{OUT} + \textcircled{1} + \textcircled{2} + \textcircled{3} + \textcircled{4}} \quad [\text{nsec}] \quad (14)$$

However since the parasitic resistance of the PCB layout pattern exists in actual applications and affects the parameter, please also verify experimentally.

### ●PCB Layout Guide

Two high pulsing current flowing loops exist in the buck regulator system.

The first loop, when FET is ON, starts from the input capacitors, to the VIN terminal, to the SW terminal, to the inductor, to the output capacitors, and then returns to the input capacitor through GND.

The second loop, when FET is OFF, starts from the low FET, to the inductor, to the output capacitor, and then returns to the low FET through GND.

To reduce the noise and improve the efficiency, please minimize these two loop area.

Especially input capacitor and output capacitor should be connected to GND (PGND) plain.

PCB Layout may affect the thermal performance, noise and efficiency greatly. So please take extra care when designing PCB Layout patterns.

Fig.26 Current loop Buck regulator system

- The thermal Pad on the back side of IC has the great thermal conduction to the chip. So using the GND plain as broad and wide as possible can help thermal dissipation. And a lot of thermal via for helping the spread of heat to the different layer is also effective.
- The input capacitors should be connected to PGND as close as possible to the VIN terminal.
- The inductor and the output capacitors should be placed close to SW pin as much as possible.

●List of Evaluation Board Components

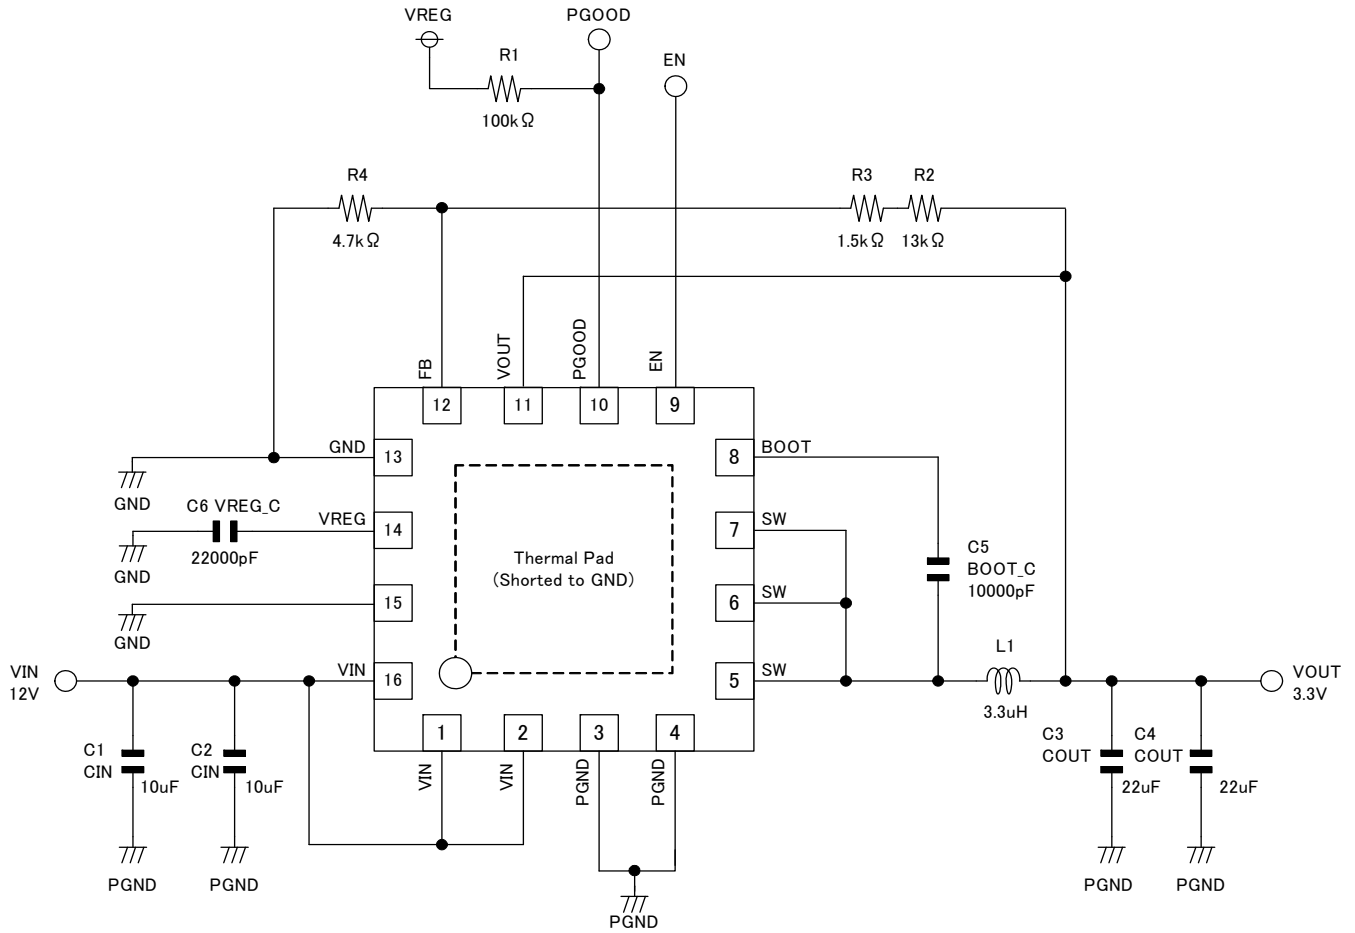

Fig.27 Typical Application Circuit

• Recommended Components List (VIN=12V, VOUT=3.3V)

Symbol	Part	Value	Manufacture	Series
L1	Coil	3.3μH	TOKO	FDVC0630-3R3M
			TDK	SPM6530-3R3M
CIN (C1, C2)	Ceramic capacitor	10μF / 25V	Murata	GRM31CR71E16KA12
COUT (C3, C4)	Ceramic capacitor	22μF / 16V	Murata	GRM31CB31C226ME15
BOOT_C (C5)	Ceramic capacitor	10000pF / 50V	Murata	GRM18 Series
R1	Resistance	100kΩ	Rohm	MCR03 Series
R2	Resistance	13kΩ	Rohm	MCR03 Series
R3	Resistance	1.5kΩ	Rohm	MCR03 Series
R4	Resistance	4.7kΩ	Rohm	MCR03 Series
VREG_C (C6)	Ceramic capacitor	22000pF / 50V	Murata	GRM18 Series

※The above components list is an example. Please check actual circuit characteristics on the application carefully before use.

● I/O Equivalence circuit

## ●Operational Notes

- (1) Absolute Maximum Ratings  
Use of the IC in excess of absolute maximum ratings may result in damage to the IC. Assumptions should not be made regarding the state of the IC (e.g., short mode or open mode) when such damage is suffered. If operational values are expected to exceed the maximum ratings for the device, consider adding protective circuitry (such as fuses) to eliminate the risk of damaging the IC.
- (2) GND voltage  
The potential of the GND, PGND pin must be the minimum potential in the system in all operating conditions.
- (3) Thermal design  
Use a thermal design that allows for a sufficient margin for power dissipation (Pd) under actual operating conditions
- (4) Inter-pin Shorts and Mounting Errors  
Use caution when orienting and positioning the IC for mounting on printed circuit boards. Improper mounting may result in damage to the IC. Shorts between output pins or between output pins and the power supply and GND pins caused by poor soldering or foreign objects may result in damage to the IC.
- (5) Operation in Strong Electromagnetic Fields  
Using this product in strong electromagnetic fields may cause IC malfunction. Caution should be exercised in applications where strong electromagnetic fields may be present.
- (6) ASO (Area of Safe Operation)  
When using the IC, ensure that operating conditions do not exceed absolute maximum ratings or ASO of the output transistors.
- (7) Testing on application boards  
When testing the IC on an application board, connecting a capacitor directly to a low-impedance pin may subject the IC to stress. Always discharge capacitors completely after each process or step. The IC's power supply should always be turned off completely before connecting or removing it from a jig or fixture during the evaluation process. To prevent damage from static discharge, ground the IC during assembly and use similar precautions during transport and storage.
- (8) Electrical Characteristics  
The electrical characteristics indicated in this datasheet may change upon the conditions of temperature, supply voltage, and external components. Please validate/verify your design at the worst case conditions.
- (9) Not of a radiation-resistant design.
- (10) Back Electromotive Force  
If a large inductive load is connected at the output pin that might cause introducing back electromotive force at the start up and at the output disable, please insert protection diodes.

Fig.28 Back Electromotive Force

- (11) Regarding input pins of the IC  
This monolithic IC contains P+ isolation and P substrate layers between adjacent elements in order to keep them isolated. PN junctions are formed at the intersection of these P layers with the N layers of other elements, creating parasitic diodes and/or transistors. For example (refer to the figure below):

- When GND > Pin A and GND > Pin B, the PN junction operates as a parasitic diode
- When GND > Pin B, the PN junction operates as a parasitic transistor

Parasitic diodes occur inevitably in the structure of the IC, and the operation of these parasitic diodes can result in mutual interference among circuits, operational faults, or physical damage. Accordingly, conditions that cause these diodes to operate, such as applying a voltage lower than the GND voltage to an input pin (and thus to the P substrate) should be avoided.

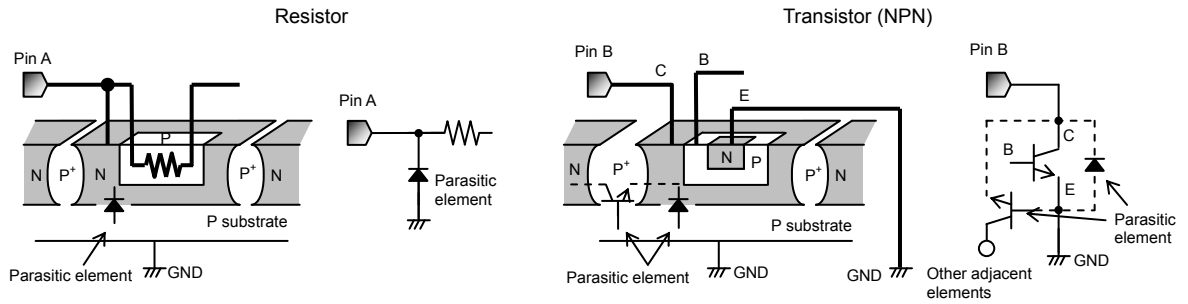

Fig.29 Example of IC structure

(12) Ground Wiring Pattern

When using both small-signal and large-current GND traces, the two ground traces should be routed separately but connected to a single ground potential within the application in order to avoid variations in the small-signal ground caused by large currents. Also ensure that the GND traces of external components do not cause variations on GND voltage.

(13) Operating Condition

The electrical characteristics indicated in this datasheet are not guaranteed for the whole operational and temperature ranges, however these characteristics do not significantly fluctuate within the operational and temperature ranges.

(14) Thermal shutdown (TSD) circuit

The IC incorporates a built-in thermal shutdown circuit, which is designed to turn the IC off completely in the event of thermal overload. It is not designed to protect the IC from damage or guarantee its operation. ICs should not be used after this function has activated, or in applications where the operation of this circuit is assumed. If the thermal shutdown is activated while the load current exists, the output may possibly be latched off at the release of the thermal shutdown.

TSD ON Temp.[°C] (typ.)	Hysteresis Temp[°C] (typ.)
175	25

(15) Heat Sink (FIN)

The heat sink (FIN) is connected to the substrate. Please connect it to GND.

# Notice

## ●General Precaution

- 1) Before you use our Products, you are requested to carefully read this document and fully understand its contents. ROHM shall not be in any way responsible or liable for failure, malfunction or accident arising from the use of any ROHM's Products against warning, caution or note contained in this document.
- 2) All information contained in this document is current as of the issuing date and subject to change without any prior notice. Before purchasing or using ROHM's Products, please confirm the latest information with a ROHM sales representative.

## ●Precaution on using ROHM Products

- 1) Our Products are designed and manufactured for application in ordinary electronic equipments (such as AV equipment, OA equipment, telecommunication equipment, home electronic appliances, amusement equipment, etc.). If you intend to use our Products in devices requiring extremely high reliability (such as medical equipment, transport equipment, traffic equipment, aircraft/spacecraft, nuclear power controllers, fuel controllers, car equipment including car accessories, safety devices, etc.) and whose malfunction or failure may cause loss of human life, bodily injury or serious damage to property ("Specific Applications"), please consult with the ROHM sales representative in advance. Unless otherwise agreed in writing by ROHM in advance, ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties arising from the use of any ROHM's Products for Specific Applications.
- 2) ROHM designs and manufactures its Products subject to strict quality control system. However, semiconductor products can fail or malfunction at a certain rate. Please be sure to implement, at your own responsibilities, adequate safety measures including but not limited to fail-safe design against the physical injury, damage to any property, which a failure or malfunction of our Products may cause. The following are examples of safety measures:
  - [a] Installation of protection circuits or other protective devices to improve system safety
  - [b] Installation of redundant circuits to reduce the impact of single or multiple circuit failure
- 3) Our Products are designed and manufactured for use under standard conditions and not under any special or extraordinary environments or conditions, as exemplified below. Accordingly, ROHM shall not be in any way responsible or liable for any damages, expenses or losses arising from the use of any ROHM's Products under any special or extraordinary environments or conditions. If you intend to use our Products under any special or extraordinary environments or conditions (as exemplified below), your independent verification and confirmation of product performance, reliability, etc. prior to use, must be necessary:
  - [a] Use of our Products in any types of liquid, including water, oils, chemicals, and organic solvents
  - [b] Use of our Products outdoors or in places where the Products are exposed to direct sunlight or dust
  - [c] Use of our Products in places where the Products are exposed to sea wind or corrosive gases, including Cl<sub>2</sub>, H<sub>2</sub>S, NH<sub>3</sub>, SO<sub>2</sub>, and NO<sub>2</sub>
  - [d] Use of our Products in places where the Products are exposed to static electricity or electromagnetic waves
  - [e] Use of our Products in proximity to heat-producing components, plastic cords, or other flammable items
  - [f] Sealing or coating our Products with resin or other coating materials
  - [g] Use of our Products without cleaning residue of flux (even if you use no-clean type fluxes, cleaning residue of flux is recommended); or Washing our Products by using water or water-soluble cleaning agents for cleaning residue after soldering
  - [h] Use of the Products in places subject to dew condensation
- 4) The Products are not subject to radiation-proof design.
- 5) Please verify and confirm characteristics of the final or mounted products in using the Products.
- 6) In particular, if a transient load (a large amount of load applied in a short period of time, such as pulse) is applied, confirmation of performance characteristics after on-board mounting is strongly recommended. Avoid applying power exceeding normal rated power; exceeding the power rating under steady-state loading condition may negatively affect product performance and reliability.
- 7) De-rate Power Dissipation (Pd) depending on Ambient temperature (Ta). When used in sealed area, confirm the actual ambient temperature.
- 8) Confirm that operation temperature is within the specified range described in the product specification.
- 9) ROHM shall not be in any way responsible or liable for failure induced under deviant condition from what is defined in this document.

**●Precaution for Mounting / Circuit board design**

- 1) When a highly active halogenous (chlorine, bromine, etc.) flux is used, the residue of flux may negatively affect product performance and reliability.
- 2) In principle, the reflow soldering method must be used; if flow soldering method is preferred, please consult with the ROHM representative in advance.

For details, please refer to ROHM Mounting specification

**●Precautions Regarding Application Examples and External Circuits**

- 1) If change is made to the constant of an external circuit, please allow a sufficient margin considering variations of the characteristics of the Products and external components, including transient characteristics, as well as static characteristics.
- 2) You agree that application notes, reference designs, and associated data and information contained in this document are presented only as guidance for Products use. Therefore, in case you use such information, you are solely responsible for it and you must exercise your own independent verification and judgment in the use of such information contained in this document. ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties arising from the use of such information.

**●Precaution for Electrostatic**

This Product is electrostatic sensitive product, which may be damaged due to electrostatic discharge. Please take proper caution in your manufacturing process and storage so that voltage exceeding the Products maximum rating will not be applied to Products. Please take special care under dry condition (e.g. Grounding of human body / equipment / solder iron, isolation from charged objects, setting of Ionizer, friction prevention and temperature / humidity control).

**●Precaution for Storage / Transportation**

- 1) Product performance and soldered connections may deteriorate if the Products are stored in the places where:
  - [a] the Products are exposed to sea winds or corrosive gases, including Cl<sub>2</sub>, H<sub>2</sub>S, NH<sub>3</sub>, SO<sub>2</sub>, and NO<sub>2</sub>
  - [b] the temperature or humidity exceeds those recommended by ROHM
  - [c] the Products are exposed to direct sunshine or condensation
  - [d] the Products are exposed to high Electrostatic
- 2) Even under ROHM recommended storage condition, solderability of products out of recommended storage time period may be degraded. It is strongly recommended to confirm solderability before using Products of which storage time is exceeding the recommended storage time period.
- 3) Store / transport cartons in the correct direction, which is indicated on a carton with a symbol. Otherwise bent leads may occur due to excessive stress applied when dropping of a carton.
- 4) Use Products within the specified time after opening a humidity barrier bag. Baking is required before using Products of which storage time is exceeding the recommended storage time period.

**●Precaution for Product Label**

QR code printed on ROHM Products label is for ROHM's internal use only.

**●Precaution for Disposition**

When disposing Products please dispose them properly using an authorized industry waste company.

**●Precaution for Foreign Exchange and Foreign Trade act**

Since our Products might fall under controlled goods prescribed by the applicable foreign exchange and foreign trade act, please consult with ROHM representative in case of export.

**●Precaution Regarding Intellectual Property Rights**

- 1) All information and data including but not limited to application example contained in this document is for reference only. ROHM does not warrant that foregoing information or data will not infringe any intellectual property rights or any other rights of any third party regarding such information or data. ROHM shall not be in any way responsible or liable for infringement of any intellectual property rights or other damages arising from use of such information or data.:
- 2) No license, expressly or implied, is granted hereby under any intellectual property rights or other rights of ROHM or any third parties with respect to the information contained in this document.

●Other Precaution

- 1) The information contained in this document is provided on an "as is" basis and ROHM does not warrant that all information contained in this document is accurate and/or error-free. ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties resulting from inaccuracy or errors of or concerning such information.
- 2) This document may not be reprinted or reproduced, in whole or in part, without prior written consent of ROHM.
- 3) The Products may not be disassembled, converted, modified, reproduced or otherwise changed without prior written consent of ROHM.
- 4) In no event shall you use in any way whatsoever the Products and the related technical information contained in the Products or this document for any military purposes, including but not limited to, the development of mass-destruction weapons.
- 5) The proper names of companies or products described in this document are trademarks or registered trademarks of ROHM, its affiliated companies or third parties.
