

Features

- 15 dB Gain
- 22.5 dBm P1dB at 22 GHz
- 4.5 dB Noise Figure at 26 GHz
- Unconditional Stability over Temperature Range
- 100% On-Wafer RF, DC and Output Power Testing
- 100% Visual Inspection to MIL-STD-883 Method 2010
- RoHS* Compliant and 260°C Reflow Compatible

Description

M/A-COM Tech's 30 kHz - 40 GHz GaAs MMIC distributed amplifier has a gain of 15 dB with a 4.5 dB noise figure at 26 GHz. This MMIC uses M/A-COM Tech's GaAs PHEMT device model technology, and is based upon electron beam lithography to ensure high repeatability and uniformity. The chip has surface passivation to protect and provide a rugged part with backside via holes and gold metallization to allow either a conductive epoxy or eutectic solder die attach process. This device is well suited for microwave, millimeter-wave, military, wideband and instrumentation applications.

- Pin1: RF IN
- Pin2: VG2, not connected for basic application, but can be used for gain control (VG2 = 2V to -2V)
- Pin3: VG3, not connected for basic application, can be used for gain peaking
- Pin4: VD Aux, not connected, but can be used for capacitive bypass for operation at frequencies lower than 2 GHz
- Pin5: VD – detector bias, the same as VD for the amplifier
- Pin6: VDR – bias voltage for reference diode (see application note)
- Pin7: VDREF – detector reference (see application note)
- Pin8: VDET – detector diode (see application note)
- Pin9: RFOUT
- Pin10: VG4, not connected
- Pin11: VG1, first gate bias typically bias at -2.5V to get -0.5V on the device.

MTTF

These numbers were calculated based upon accelerated life test information received from the fabricating foundry and extensive thermal modeling/finite element analysis done at Mimix Broadband. The values shown here are only to be used as a guideline against the end application requirements and only represent reliability information under one bias condition. Ultimately bias conditions and resulting power dissipation along with the practical aspects, i.e. thermal material stack-up, attach method of die placement are the key parts in determining overall reliability for a specific application, see previous pages. If the data shown below does not meet your reliability requirements or if the bias conditions are not within your operating limits please contact technical sales for additional information.

XD1008-BD: MTTF (hours) vs. Backside Temp (C)
Vdd = 6.0 V, Idd = 187 mA

XD1008-BD: Rth (C/W) vs. Backside Temp (C)
Vdd = 6.0 V, Idd = 187 mA

XD1008-BD: Tch_max (C) vs. Backside Temp (C)
Vdd = 6.0 V, Idd = 187 mA

App Note [1] Biasing - The detector diode can be used to measure output power over a broad bandwidth. The detector diode is biased through the PA drain supply and the output voltage is measured at VDET with a high impedance voltage measurement device. A reference diode is also included which may be used to compensate for temperature and manufacturing process variation. The reference diode is biased through pin VDR with the same voltage as the PA drain supply and the voltage difference $V_{\Delta} = V_{DET} - V_{REF}$ is used to measure output power with temperature and manufacturing process compensation.

Handling Procedures

Please observe the following precautions to avoid damage:

Static Sensitivity

Gallium Arsenide Integrated Circuits are sensitive to electrostatic discharge (ESD) and can be damaged by static electricity. Proper ESD control techniques should be used when handling these class 2 devices.
