*1 : Case temperature (T_c) measured point is just under the chips.

If you use this value, Rth(f-a) should be measured just under the chips.

*2 : Typical value is measured by using thermally conductive grease of λ = 0.9[W/(m • K)].

Note 1. IE, VEC, trr & Qrr represent characteristics of the anti-parallel, emitter-collector free-wheel diode (FWDi).

2. Pulse width and repetition rate should be such that the device junction temperature (T_J) does not exceed T_{Jmax} rating.

3. Junction temperature (T_J) should not increase beyond 150°C.

4. Pulse width and repetition rate should be such as to cause negligible temperature rise.
