

AS3648

2000mA High Current LED Flash Driver

1 General Description

The AS3648 is an inductive high efficient DCDC step up converter with two current sinks. The DCDC step up converter operates at a fixed frequency of 4MHz and includes soft startup to allow easy integration into noise sensitive RF systems. The two current sinks can operate in flash / torch / assist (=video) light modes.

The AS3648 includes flash timeout, overvoltage, over-temperature, undervoltage and LED short circuit protection functions. A TXMASK/TORCH function reduces the flash current in case of parallel operation to the RF power amplifier and avoids a system shutdown. Alternatively this pin can be used to directly operate the torch light directly.

The AS3648 is controlled by an I²C interface and has a hardware automatic shutdown if SCL=0 for 100ms. Therefore no additional enable input is required for shutting down of the device once the system shuts down.

The AS3648 is available in a space-saving WL-CSP package measuring only 2.25x1.5x0.5mm and operates over the -30°C to +85°C temperature range.

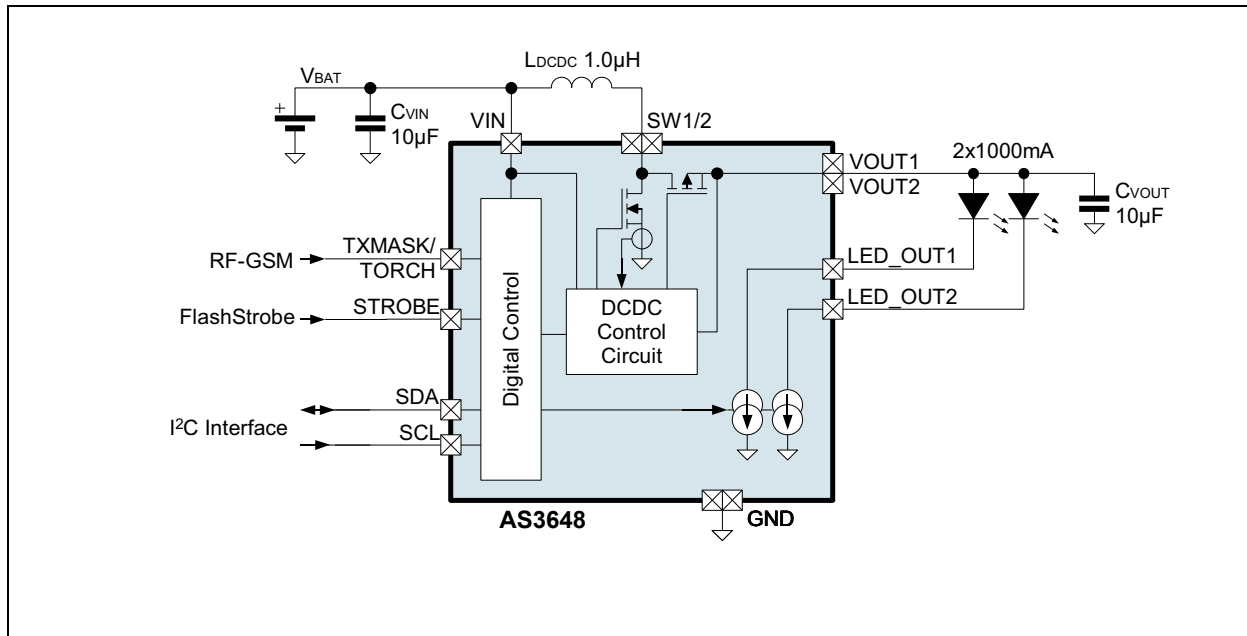

2 Key Features

- High efficiency 4MHz fixed frequency DCDC Boost converter with soft start allows small coils
 - Stable even in coil current limit
- LED current adjustable up to 2000mA
- Two LED operation or single LED operation (combine LED_OUT1 with LED_OUT2)
- Automatic current adjustment for low battery voltage
- PWM operation for lower output current for reliable light output of the LED; running at 31.5kHz to avoid audible noise
- Protection functions:
 - Automatic Flash Timeout timer to protect the LED(s)
 - Overvoltage and undervoltage Protection
 - Overtemperature Protection
 - LED short/open circuit protection
- I²C Interface with automatic shutdown
- 5V constant voltage mode operation
- Available in tiny WL-CSP Package, 13 balls 0.5mm pitch, 2.25x1.5x0.5mm package size

3 Applications

Flash/Torch for mobile phones, digital cameras and PDA

Pin Description

Table 1. Pin Description for AS3648

Pin Number	Pin Name	Description
A1	VOUT1	DCDC converter output capacitor - make a short connection to Cvout / VOUT2
A2	GND	Power and analog ground; make a short connection between both balls
A3	LED_OUT1	Flash LED current sink
B1	SW1	DCDC converter switching node - make a short connection to SW2 / coil LDCDC
B2	GND	Power and analog ground; make a short connection between both balls
C1	VOUT2	DCDC converter output capacitor - make a short connection to Cvout / VOUT1
C2	SW2	DCDC converter switching node - make a short connection to SW1 /coil LDCDC
C3	LED_OUT2	Flash LED current sink
D1	SCL	serial clock input for I ² C interface
D2	VIN	Positive supply voltage input - connect to supply and make a short connection to input capacitor CvIN and to coil LDCDC
E1	SDA	serial data input/output for I ² C interface (needs external pullup resistor)
E2	STROBE	Digital input with pulldown to control strobe time for flash function
E3	TXMASK/ TORCH	Function 1: Connect to RF power amplifier enable signal - reduces currents during flash to avoid a system shutdown due to parallel operation of the RF PA and the flash driver Function 2: Operate torch current level without using the I ² C interface to operate the torch without need to start a camera processor (if the I ² C is connected to the camera processor)

5 Absolute Maximum Ratings

Stresses beyond those listed in Table 3 may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in Table 4, "Electrical Characteristics," on page 4 is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Table 3. Absolute Maximum Ratings

Parameter	Min	Max	Units	Comments
VIN to GND	-0.3	+7.0	V	
STROBE, TXMASK/TORCH, SCL, SDA to GND	-0.3	VIN + 0.3	V	max. +7V
SW1/2, VOUT1/2, LED_OUT1/2 to GND	-0.3	+7.0	V	
VOUT1/2 to SW1/2	-0.3		V	Note: Diode between VOUT1/2 and SW1/2
voltage between GND pins	0.0	0.0	V	short connection recommended
Input Pin Current without causing latchup	-100	+100 +IIN	mA	Norm: EIA/JESD78
Continuous Power Dissipation (TA = +70°C)				
Continuous power dissipation		1230	mW	PT at 70°C ¹
Continuous power dissipation derating factor		16.7	mW/°C	PDERATE ²
Electrostatic Discharge				
ESD HBM pins LED_OUT1/2 ³		±8000	V	Norm: JEDEC JESD22-A114F
ESD HBM		±2000	V	
ESD CDM		±500	V	Norm: JEDEC JESD 22-C101E
ESD MM		±100	V	Norm: JEDEC JESD 22-A115-B
Temperature Ranges and Storage Conditions				
Junction to ambient thermal resistance		60 ⁴	°C/W	For more information about thermal metrics, see application note AN01 Thermal Characteristics
Junction Temperature		+150	°C	Internally limited (overtemperature protection), max. 20000s
Storage Temperature Range	-55	+125	°C	
Humidity	5	85	%	Non condensing
Body Temperature during Soldering		+260	°C	according to IPC/JEDEC J-STD-020
Moisture Sensitivity Level (MSL)	MSL 1			Represents a max. floor life time of unlimited

1. Depending on actual PCB layout and PCB used measured on demoboard; for peak power dissipation during flashing see document 'AS3648 Thermal Measurements'
2. PDERATE derating factor changes the total continuous power dissipation (PT) if the ambient temperature is not 70°C. Therefore for e.g. TAMB=85°C calculate PT at 85°C = PT - PDERATE * (85°C - 70°C)
3. Pins LED_OUT1 connected to LED_OUT2 and capacitor CVOUT connected to VOUT1/2 and GND; both GND pins connected together
4. Measured on AS3648 Demoboard.

6 Electrical Characteristics

$V_{VIN} = +2.7V$ to $+4.4V$, $T_{AMB} = -30^{\circ}C$ to $+85^{\circ}C$, unless otherwise specified. Typical values are at $V_{VIN} = +3.7V$, $T_{AMB} = +25^{\circ}C$, unless otherwise specified.

Table 4. Electrical Characteristics

Symbol	Parameter	Condition	Min	Typ	Max	Unit	
General Operating Conditions							
V_{VIN}	Supply Voltage	pin VIN	2.7	3.7	4.4	V

$t_{SU:DAT}$	Data Setup Time ⁸		100			ns
t_R	Rise Time of Both SDA and SCL Signals		$20 + 0.1C_B$		300	ns
t_F	Fall Time of Both SDA and SCL Signals		$20 + 0.1C_B$		300	ns
$t_{SU:STO}$	Setup Time for STOP Condition		0.6			μs
C_B	Capacitive Load for Each Bus Line	C_B — total capacitance of one bus line in pF			400	pF
$C_{I/O}$	I/O Capacitance (SDA, SCL)				10	pF

1. To improve efficiency at low output currents, the active part of the internal switching transistor PMOS is reduced in size to 1/5 its original size. This reduces the current required to drive the PMOS transistor and therefore improves overall efficiency at low output currents.
2. The maximum current driving capability depends on supply voltage V_{VIN} , LED forward voltage and coil peak current limit.
3. Due to slope compensation of the current limit, I_{LIMIT} changes with duty cycle - see [Figure on page 10](#).
4. The logic input levels V_{IH} and V_{IL} allow for 1.2V or 1.8V supplied driving circuit
5. A pulldown current of $36\mu A$ is equal to a pulldown resistor of $42k\Omega$ at 1.5V
6. After this period, the first clock pulse is generated.
7. A device must internally provide a hold time of at least 300ns for the SDA signal (referred to the V_{IHMIN} of the SCL signal) to bridge the undefined region of the falling edge of SCL.
8. A fast-mode device can be used in a standard-mode system, but the requirement $t_{SU:DAT} =$ to 250ns must then be met. This is automatically the case if the device does not stretch the LOW period of the SCL signal. If such a device does stretch the LOW period of the SCL signal, it must output the next data bit to the SDA line $t_R \max + t_{SU:DAT} = 1000 + 250 = 1250ns$ before the SCL line is released.

8 Detailed Description

The AS3648 is a high performance DCDC step up converter with internal PMOS and NMOS switches. Its output is connected to one or two flash LEDs¹ with an internal current sink. The device is controlled by the pins SDA and SCL in I²C mode.

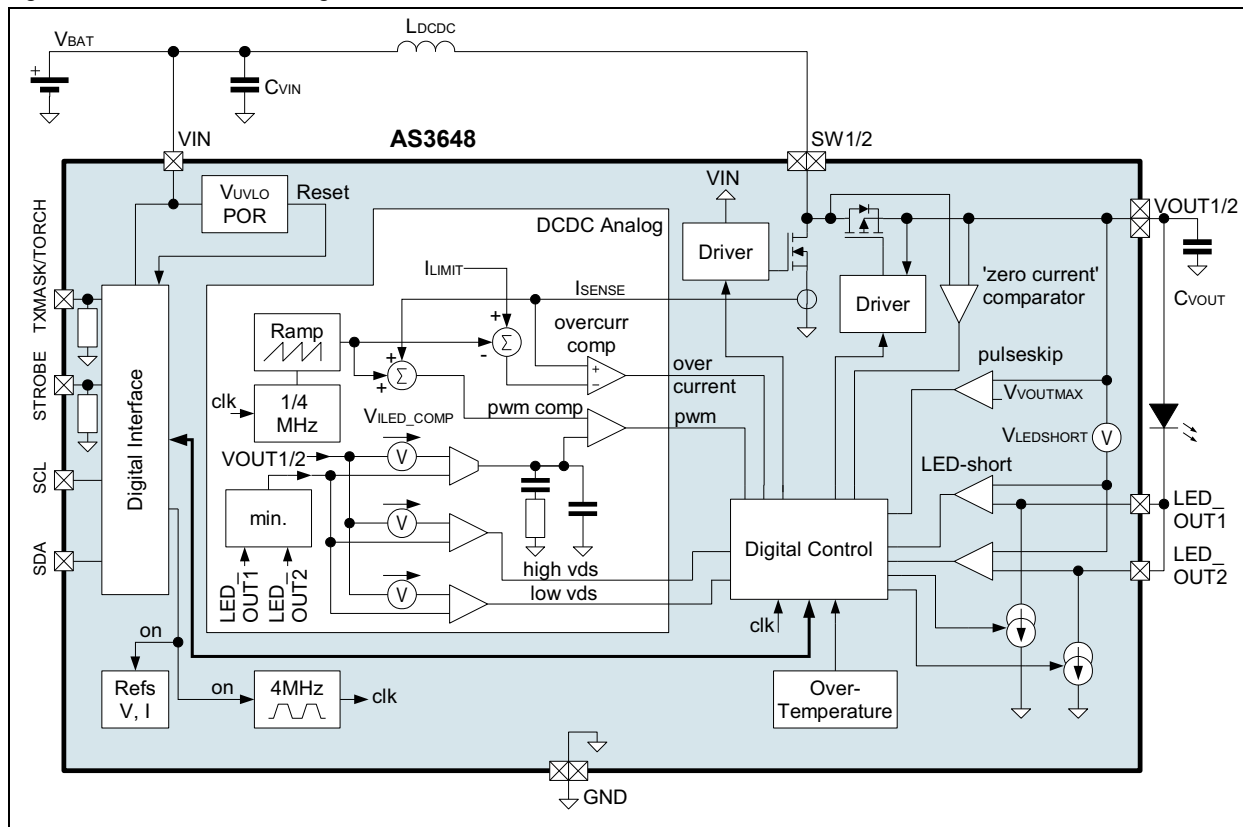

The actual operating mode like standby, assist light, indicator or flash mode, can then be chosen by the interface. If not in standby mode, the device automatically enters shutdown mode by keeping SCL low for more than $t_{TIMEOUT}$ ².

The AS3648 includes a fixed frequency DCDC step-up with accurate startup control. Together with the current sink (on LED_OUT1/2) it includes several protection and safety functions.

The DCDC converter always operates in PWM mode (exception: PFM mode is allowed during startup until 60mA output current to reduce EMI in EMI sensitive systems).

Internal Circuit Diagram

Figure 16. Internal circuit Diagram

Softstart / Soft ramp down

During startup and ramp down the LED current is smoothly ramped up and ramped down. If the DCDC converter goes out of regulation (measured by monitoring the voltage across the current sinks), the ramp up is temporarily stopped in order for the DCDC to return to regulation³.

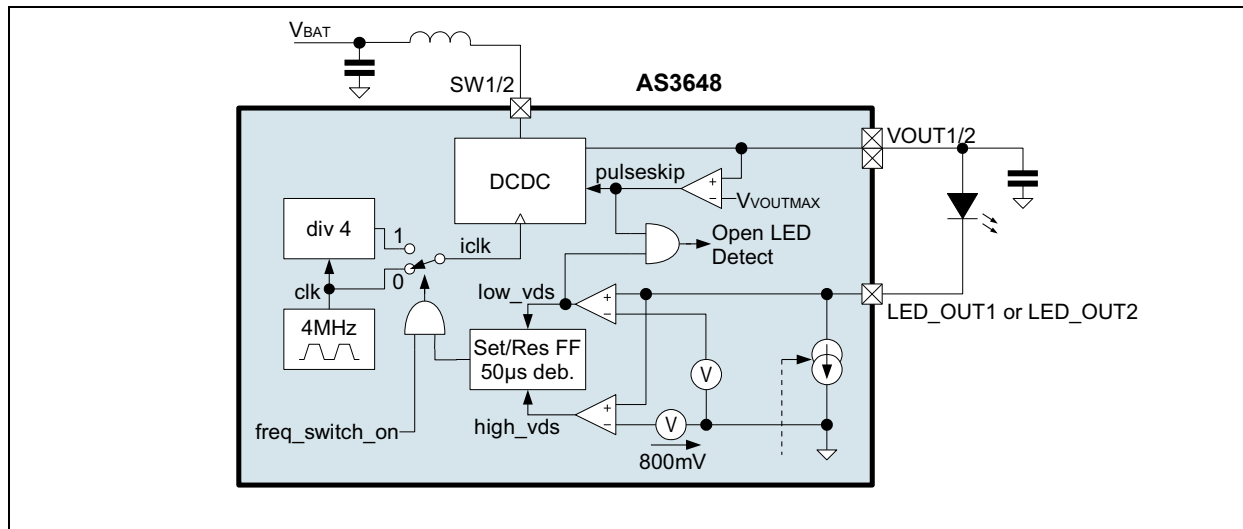

1. If two LEDs are connected, it is possible to operate each of the two LEDs individually as the LED current can be selected individually.
2. Following registers are reset to their default value if the timeout expires: `out_on=0`, `ext_torch_on=00`, `mode_setting=00`, `const_v_mode=0`.
3. The actual value of the LED current setting can be readout by the register `led_current_actual` (see page 29) to allow the camera processor to adopt to the actual operating conditions.

1/4MHz Operating Mode Switching

If `freq_switch_on` (see page 28)=1 and in flash and assist light mode (indicator mode or low current mode using PWM always will use pulseskip) if `led_current1`>=40h and `led_current2`>=40h and `current_boost`=0, the DCDC converter always operates in PWM mode (exception: PFM mode is allowed during startup) to reduce EMI in EMI sensitive systems. For flash and assist light mode and high duty cycles close to 100% on-time (maximum duty cycle) of the PMOS, the DCDC converter can switch into a 1MHz operating mode and maximum duty cycle to improve efficiency for this load condition. The DCDC converter returns back to its normal 4MHz operating frequency when load or supply conditions change. Due to this switching between two fixed frequencies the noise spectrum of the system is exactly defined and predictable. If improved efficiency is required, the fixed switching between 1MHz / 4MHz can be disabled by `freq_switch_on` (see page 28)=0. In this case pulseskip will be used.

The internal circuit for switching between these two frequencies is shown in Figure 17:

Figure 17. Internal circuit of 4MHz/1Mhz selection

Note: For simplicity Figure 17 shows only a single current sink.

Protection and Fault Detection Functions

The protection functions protect the AS3648 and the LED(s) against physical damage. In most cases a `Fault` register bit is set, which can be readout by the I²C interface. The fault bits are automatically cleared by a I²C readout of the fault register. Additionally the DCDC is stopped and the current sinks are disabled⁴ by resetting `out_on`=0, `mode_setting`=00 and `ext_torch_on`=00.

Overvoltage Protection

In case of no or a broken LED(s) at the pin LED_OUT1/2 and an enabled DCDC converter, the voltage on VOUT1/2 rises until it reaches VVOUTMAX (overvoltage condition). If this condition is detected, the DCDC converter is stopped, the current sinks are disabled and the bit `fault_ovp` (see page 28)⁵ is set⁶.

4. Applies for all faults except `TXMASK` event occurred

5. In indicator or low current mode (`mode_setting` (see page 26)=01) the register `fault_led_short` is not set under an overvoltage conditions. The output voltage is nevertheless kept below VVOUTMAX.

6. In constant voltage mode (5V generation, register bit `const_v_mode`=1) this fault is disabled.

Short Circuit Protection

After the startup of the DCDC converter, the voltage on LED_OUT1/2 is continuously monitored and compared against V_{LED_SHORT} if the LED current is above 14mA ($current_boost=0$), 15.6mA ($current_boost=1$)⁷ (see Figure 18). If the voltage across the LED ($V_{FLED} = V_{OUT1/2} - LED_OUT1/2$) stays below V_{LED_SHORT} , the DCDC is stopped (as a shorted LED is assumed), the current sinks are disabled and the bit `fault_led_short` (see page 28) is set. In a dual LED configuration for the AS3648, if a single shorted LED is detected, this LED is disabled and the device continues operation with the other LED.

Figure 18. Short LED detection

Overtemperature Protection

The junction temperature of the AS3648 is continuously monitored. If the temperature exceeds T_{OVTEMP} , the DCDC is stopped, the current sinks are disabled (instantaneous) and the bit `fault_overnote` (see page 28) is set. The driver is automatically re-enabled⁸ once the junction temperature drops below $T_{OVTEMP} - T_{OVTEMPHYST}$.

TXMASK event occurred

If during flash, TXMASK current reduction is enabled (see TXMASK on page 14, configured by `ext_torch_on=01`) and a TXMASK event happened (pin TXMASK/TORCH=1), the fault register bit `fault_txmask` (see page 27) is set.

Flash Timeout

If the flash is started a timeout timer is started in parallel. If the flash duration defined by the STROBE input (`strobe_on = 1` and `strobe_type = 1`, see Figure 26 on page 18) exceeds $t_{FLASH_TIMEOUT}$ (adjustable by register `flash_timeout` (see page 26)), the DCDC is stopped and the flash current sinks (on pin LED_OUT1/2) are disabled and `fault_timeout` is set.

If the flash duration is defined by the timeout timer itself (`strobe_on = 0`, see Figure 24 on page 17), the register `fault_timeout` is set after the flash has been finished.

Supply undervoltage Protection

If the voltage on the pin VIN (=battery voltage) is or falls below V_{UVLO} , the AS3648 is kept in shutdown state and all registers are set to their default state.

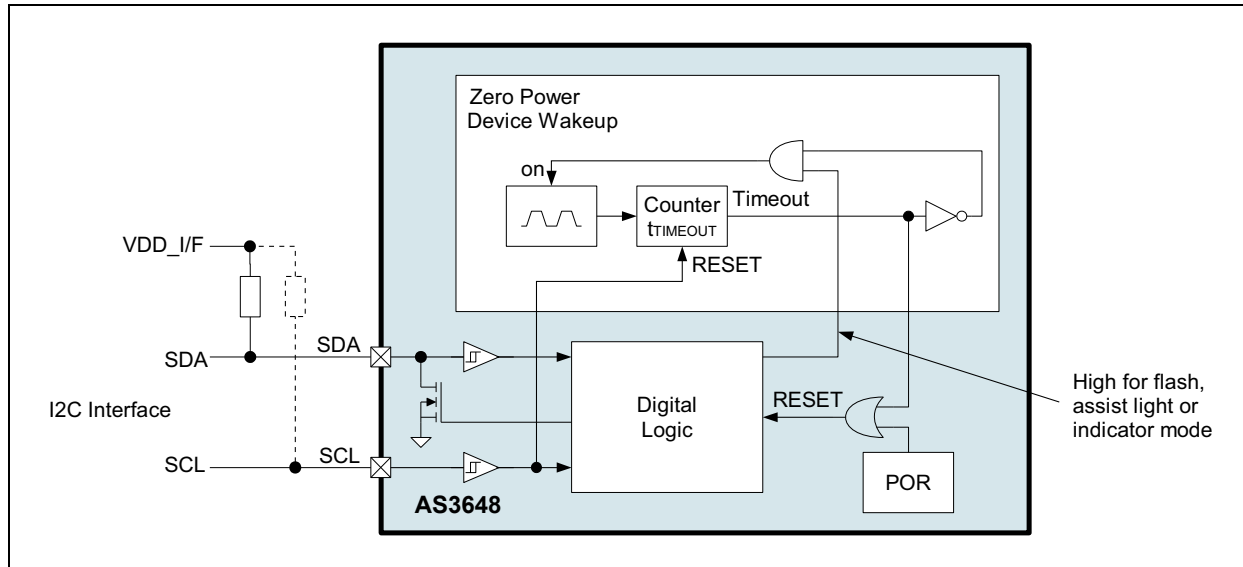

Wakeup Circuit - Power off detection

In flash, assist light and indicator mode (register `mode_setting` (page 26)=01, 10 or 11) and `out_on` (page 27)=1, if SCL is L for more than $t_{TIMEOUT}$, shutdown mode is automatically entered. This feature automatically detects a power-off of the controlling circuit driving SCL and SDA ($V_{DD_I/F}$ goes to 0V) - the internal circuit is shown in Figure 19:

7. To avoid errors in short LED detection for LEDs with a high leakage current

8. In constant voltage mode (`const_v_mode=1`) the DCDC will not be automatically re-enabled.

Figure 19. Device Shutdown and Wakeup

Operating Mode and Currents

The output currents and operating mode are selected according to the following table:

Table 5. Operating Mode and current settings

AS3648 configuration					operating mode and currents		
SCL and SDA	TORCH	STROBE	mode_setting (see page 26)	out_on (see page 27)	Condition	Mode	LED_OUT1/2 output current
SCL low for tTIME _{OUT} ¹	X	X	X	X	if previous operating mode was indicator, assist light or flash mode	shutdown all registers are reset to their default values	0

Table 5. Operating Mode and current settings (Continued)

AS3648 configuration					operating mode and currents		
SCL and SDA	TORCH	STROBE	mode setting (see page 26)	out_on (see page 27)	Condition	Mode	LED_OUT1/2 output current
I ² C commands are accepted	X	X	10, 01 or 11	0		standby	0
	X	X	00	X	ext_torch_on (see page 23) not 10		
	0	X			ext_torch_on =10		
	1	X			ext_torch_on =10	external torch mode	LED current is defined by the 7LSB ² bits of led_current1 and led_current2
	X	X	01	1		indicator mode or low current pwm mode ³	LED current is defined by the 6LSB bits (bits 5...0) of led_current1 and led_current2 pwm modulated with 31.5kHz defined by register inct_pwm (1/16...4/16)
	X	X	10	1		assist light mode	LED current is defined by the 7LSB ² bits (6...0) of led_current1 and led_current2
	X	X	11	1	strobe_on (see page 27) = 0	flash mode;	LED current is defined by led_current1 and led_current2 - the current can be reduced during flash, see Flash Current Reductions below
	X	0->1			strobe_on = 1 and strobe_type (see page 27) = 0	flash duration defined by flash_timeout (see page 26)	
	X	1			strobe_on = 1 and strobe_type = 1	flash duration defined by STROBE input; timeout defined by flash_timeout	

1. SCL low for TIMEOUT and operating mode is indicator, assist or flash mode then shutdown mode is entered.
2. The MSB bit of this register not used to protect the LED; therefore the maximum assist / torch light current = half the maximum flash current
3. The low current mode is a general purpose PWM mode to drive less current through the LED in average, but keep the actual pulsed current in a range where the light output from the LED is still specified. As only the 6 LSBs of led_current1 and led_current2 are used the maximum current is limited to 1/4 of the maximum flash current.

Flash Current Reductions

TXMASK

Usually the flash current is defined by the register led_current1 and led_current2. If the TXMASK/TORCH input is used and (configured by ext_torch_on=01), the flash current is reduced to flash_txmask_current if TXMASK/TORCH=1.

Current Reduction by VIN measurements in Flash Mode

Due to the high load of the flash driver and the ESR of the battery (especially critical at low temperatures), the voltage on the battery drops. If the voltage drops below the reset threshold of the system would reset. To prevent this condition the AS3648 monitors the battery voltage and keeps it above vin_low_v_run as follows:

Before a flash is started the voltage on VIN is measured. If the voltage is below the setting of `vin_low_v`, the flash is disabled (driver stays in shutdown) if `vin_low_v_shutdown=1` or the flash current is reduced to `flash_txmask_current` if `vin_low_v_shutdown=0` and `fault_uvlo` (see page 27) is set.

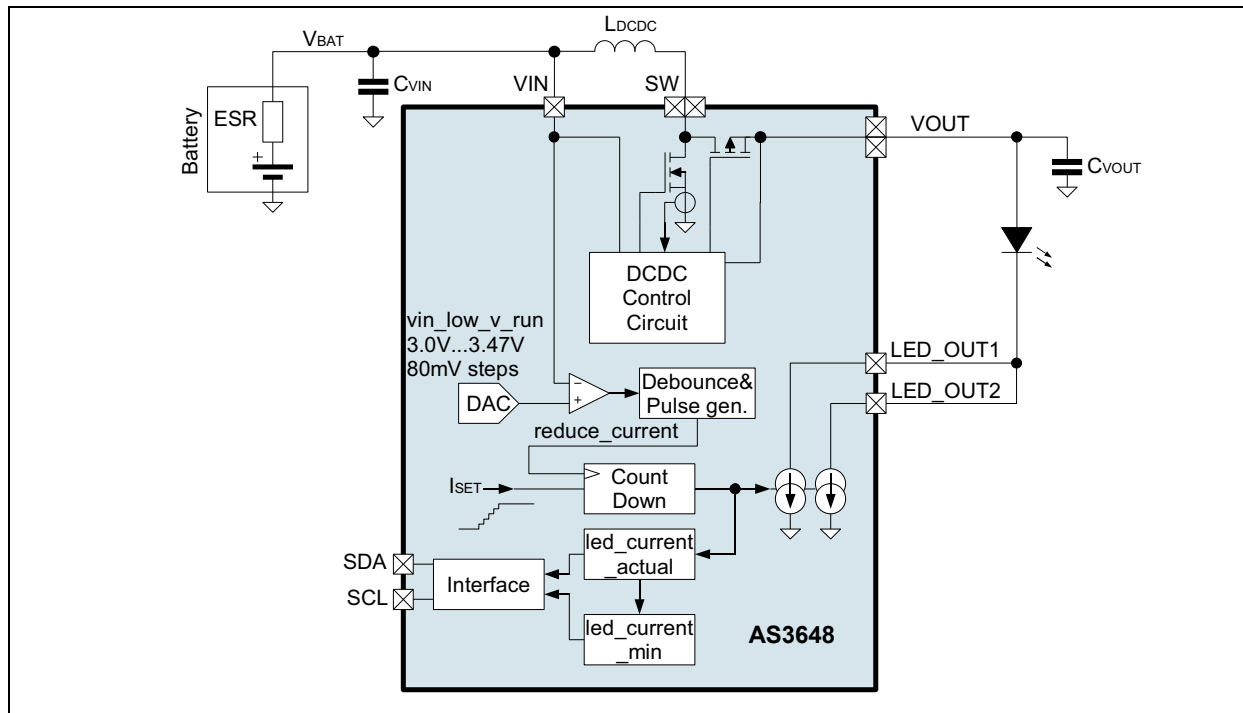

During flash, if the voltage on VIN drops below the threshold defined by `vin_low_v_run`, the flash current is reduced (or ramping of the current is stopped during flash current startup) and `fault_uvlo` is set. The timing for the reduction of the current is $8\mu\text{s}/\text{LSB}$ current change.

During the flash pulse the actual used current can be readout by the register `led_current_actual`.

After the flash pulse the minimum current can be readout by the register `led_current_min` - this allows to adjust the camera sensitivity (gain or iso-settings) for the subsequent flash pulse (e.g. when using a pre-flash and a main flash pulse).

The internal circuit for low voltage current reductions are shown in Figure 20:

Figure 20. Low Voltage current Reduction Internal Circuit

A mobile phone camera flash system can trigger a diagnostic flash and a main-flash:

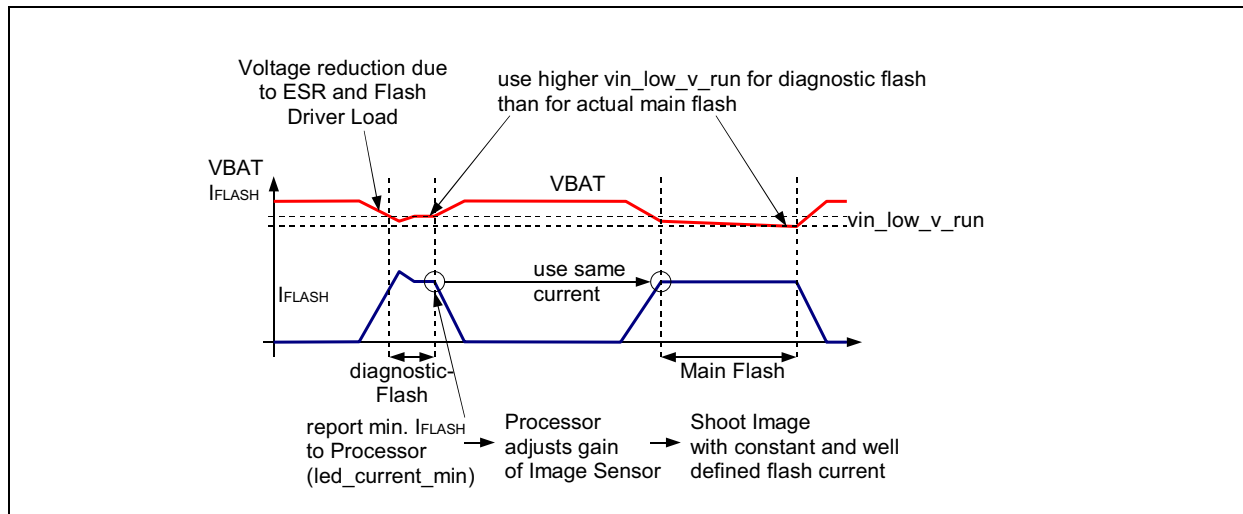

The diagnostic flash is initiated by the processor. After this diagnostic flash, the determined maximum flash current can be read back through the I²C interface from register `led_current_min` (see page 29) and used for the setting for the main flash. Therefore the current in the main-flash is constant and additionally the camera system can use this current for picture quality adjustments - the waveforms for this concept are shown in Figure 21:

Figure 21. Low Voltage current Reduction Waveform with diagnostic-Flash and Main-Flash Phase

If the diagnostic flash should be short (e.g. 10ms) it is recommended to operate this diagnostic flash at slightly higher `vin_low_v_run` setting compared to the main flash as shown in Figure 22:

Figure 22. Low Voltage current Reduction Waveform with short diagnostic-Flash and Main-Flash Phase

The different settings for `vin_low_v_run` allow a constant main flash current without dropping VIN below `vin_low_v_run`.

Load Balancing

To improve the efficiency of the AS3648 for LEDs with unmatched forward voltage and reduce the internal power dissipation of the AS3648, set the bit `load_balance_on=1`. This bit can change the currents through the LEDs by up to +/- 10% to match the forward voltage of the LED better as shown in Figure 23:

Figure 23. Load Balancing

Flash Strobe Timings

The flash timing are defined as follows:

1. Flash duration defined by register `flash_timeout` and flash is started immediately when this mode is selected by the I²C command (see Figure 24):
set `strobe_on = 0`, start the flash by setting `out_on = 1`
2. Flash duration defined by register `flash_timeout` and flash started with a rising edge on pin STROBE (see Figure 25):
set `strobe_on = 1` and `strobe_type = 0`
3. Flash start and timing defined by the pin STROBE; the flash duration is limited by the timeout timer defined by `flash_timeout` (see Figure 26 and Figure 34):
set `strobe_on = 1` and `strobe_type = 1`

Figure 24. AS3648 flash duration defined by `flash_timeout` without using STROBE input

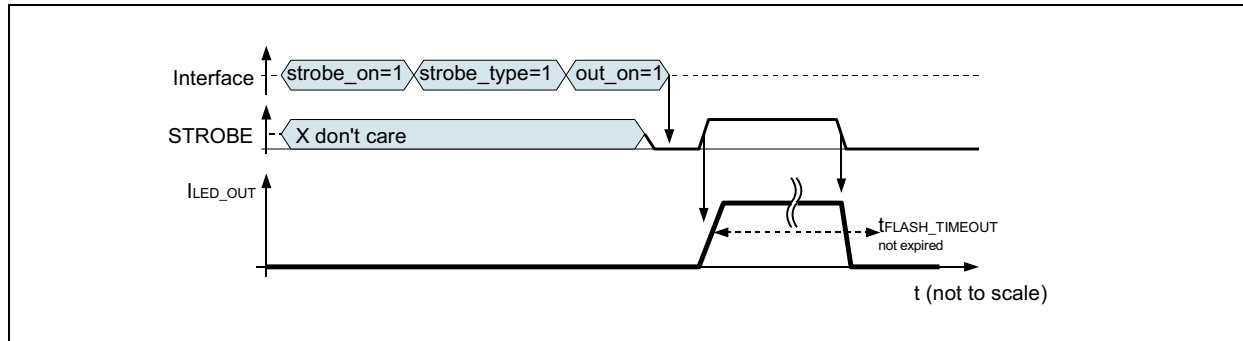

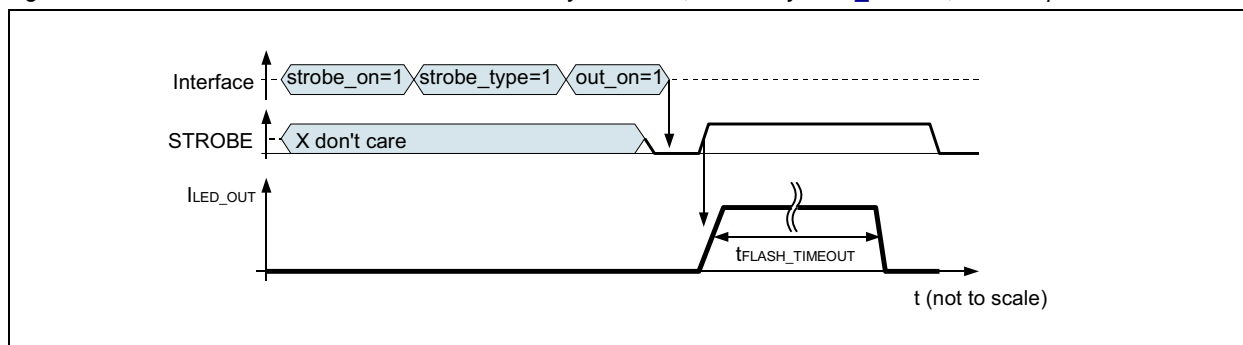

Figure 27. AS3648 flash duration and start defined by STROBE, limited by flash_timeout; timer expired

I²C Serial Data Bus

The AS3648 supports the I²C bus protocol. A device that sends data onto the bus is defined as a transmitter and a device receiving data as a receiver. The device that controls the message is called a master. The devices that are controlled by the master are referred to as slaves. A master device that generates the serial clock (SCL), controls the bus access, and generates the START and STOP conditions must control the bus. The AS3648 operates as a slave on the I²C bus. Within the bus specifications a standard mode (100kHz maximum clock rate) and a fast mode (400kHz maximum clock rate) are defined. The AS3648 works in both modes. Connections to the bus are made through the open-drain I/O lines SDA and SCL.

The following bus protocol has been defined (Figure 28):

- Data transfer may be initiated only when the bus is not busy.
- During data transfer, the data line must remain stable whenever the clock line is HIGH. Changes in the data line while the clock line is HIGH are interpreted as control signals.

Accordingly, the following bus conditions have been defined:

Bus Not Busy

Both data and clock lines remain HIGH.

Start Data Transfer

A change in the state of the data line, from HIGH to LOW, while the clock is HIGH, defines a START condition.

Stop Data Transfer

A change in the state of the data line, from LOW to HIGH, while the clock line is HIGH, defines the STOP condition.

Data Valid

The state of the data line represents valid data when, after a START condition, the data line is stable for the duration of the HIGH period of the clock signal. The data on the line must be changed during the LOW period of the clock signal. There is one clock pulse per bit of data.

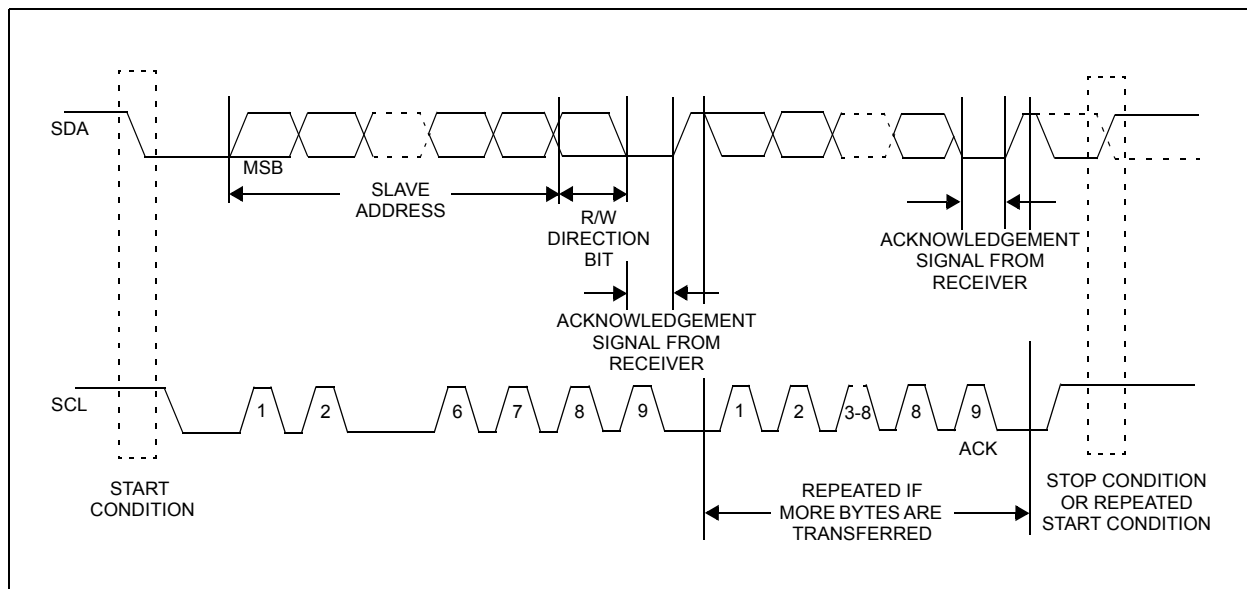

Each data transfer is initiated with a START condition and terminated with a STOP condition. The number of data bytes transferred between START and STOP conditions are not limited, and are determined by the master device. The information is transferred byte-wise and each receiver acknowledges with a ninth bit.

Acknowledge

Each receiving device, when addressed, is obliged to generate an acknowledge after the reception of each byte. The master device must generate an extra clock pulse that is associated with this acknowledge bit.

A device that acknowledges must pull down the SDA line during the acknowledge clock pulse in such a way that the SDA line is stable LOW during the HIGH period of the acknowledge-related clock pulse. Of course, setup and hold times must be taken into account. A master must signal an end of data to the slave by not generating an acknowledge bit on the last byte that has been clocked out of the slave. In this case, the slave must leave the data line HIGH to enable the master to generate the STOP condition.

Figure 28. Data Transfer on I²C Serial Bus

Depending upon the state of the R/W bit, two types of data transfer are possible:

1. **Data transfer from a master transmitter to a slave receiver.** The first byte transmitted by the master is the slave address. Next follows a number of data bytes. The slave returns an acknowledge bit after each received byte. Data is transferred with the most significant bit (MSB) first.
2. **Data transfer from a slave transmitter to a master receiver.** The master transmits the first byte (the slave address). The slave then returns an acknowledge bit, followed by the slave transmitting a number of data bytes. The master returns an acknowledge bit after all received bytes other than the last byte. At the end of the last received byte, a “not acknowledge” is returned. The master device generates all of the serial clock pulses and the START and STOP conditions. A transfer is ended with a STOP condition or with a repeated START condition. Since a repeated START condition is also the beginning of the next serial transfer, the bus is not released. Data is transferred with the most significant bit (MSB) first.

The AS3648 can operate in the following two modes:

1. **Slave Receiver Mode (Write Mode):** Serial data and clock are received through SDA and SCL. After each byte is received an acknowledge bit is transmitted. START and STOP conditions are recognized as the beginning and end of a serial transfer. Address recognition is performed by hardware after reception of the slave address and direction bit (see Figure 29). The slave address byte is the first byte received after the master generates the START condition. The slave address byte contains the 7-bit AS3648 address, which is 0110000, followed by the direction bit (R/W), which, for a write, is 0.⁹ After receiving and decoding the slave address byte the device outputs an acknowledge on the SDA line. After the AS3648 acknowledges the slave address +

9. The address for writing to the AS3648 is 60h = 01100000b

write bit, the master transmits a register address to the AS3648. This sets the register pointer on the AS3648. The master may then transmit zero or more bytes of data, with the AS3648 acknowledging each byte received. The address pointer will increment after each data byte is transferred. The master generates a STOP condition to terminate the data write.

- Slave Transmitter Mode (Read Mode):** The first byte is received and handled as in the slave receiver mode. However, in this mode, the direction bit indicates that the transfer direction is reversed. Serial data is transmitted on SDA by the AS3648 while the serial clock is input on SCL. START and STOP conditions are recognized as the beginning and end of a serial transfer (Figure 30 and Figure 31). The slave address byte is the first byte received after the master generates a START condition. The slave address byte contains the 7-bit AS3648 address, which is 0110000, followed by the direction bit (R/W), which, for a read, is 1.¹⁰ After receiving and decoding the slave address byte the device outputs an acknowledge on the SDA line. The AS3648 then begins to transmit data starting with the register address pointed to by the register pointer. If the register pointer is not written to before the initiation of a read mode the first address that is read is the last one stored in the register pointer. The AS3648 must receive a “not acknowledge” to end a read.

Figure 29. Data Write - Slave Receiver Mode

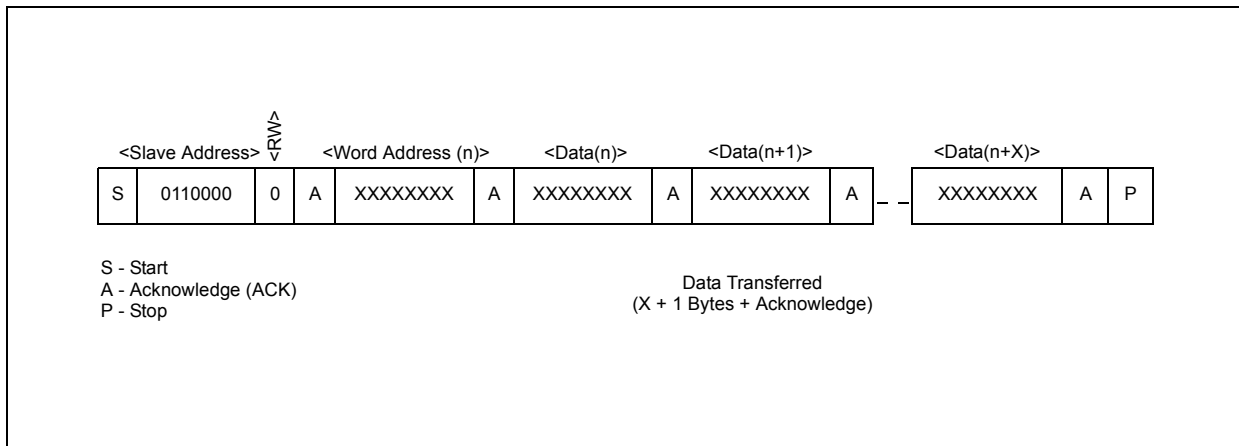

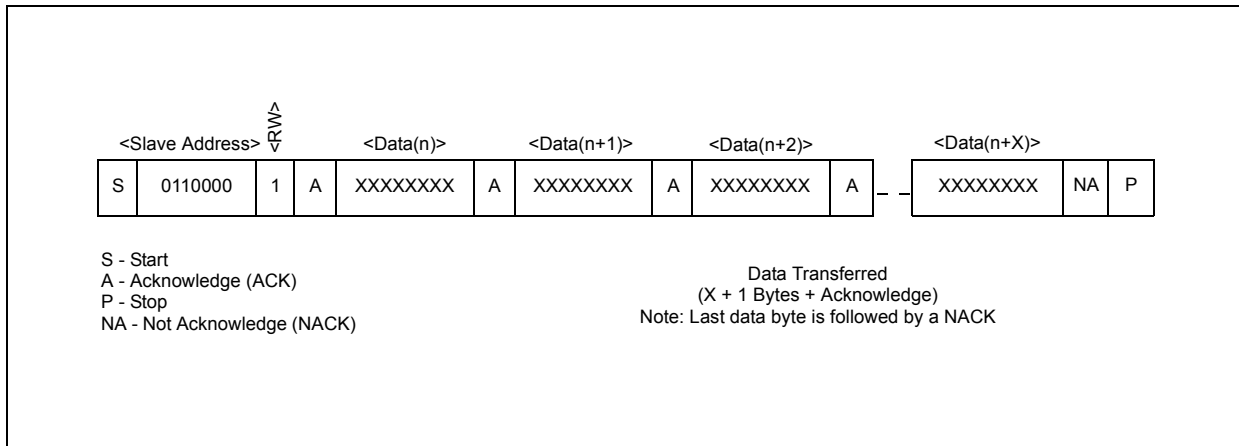

Figure 30. Data Read (from Current Pointer Location) - Slave Transmitter Mode

10. The address for read mode from the AS3648 is 61h = 01100001b

Figure 31. Data Read (Write Pointer, Then Read) - Slave Receive and Transmit

Register Description

Table 6. *ChipID Register*

Addr: 0		ChipID Register		
This register has a fixed ID				
Bit	Bit Name	Default	Access	Description
2:0	version	Xh	R	AS3648 chip version number
7:3	fixed_id	10110b	R	This is a fixed identification (e.g. to verify the I ² C communication)

Table 7. *Current Set LED1 Register*

Addr: 1		Current Set LED1 Register			
This register defines design versions					
Bit	Bit Name	Default	Access	Description	
7:0	led_current1	9Ch	R/W	Define the current on pin LED_OUT1 assist mode uses bits 6:0 of this current setting (max. half of full current setting) indicator or low current pwm mode uses only 5:0 of this current setting (max. 1/4 of full current setting)	
				0h	0mA
				1h	3.5mA
				2h	7.1mA
			
				3Fh	222.4mA (maximum current for indicator or low current pwm mode, mode_setting=01)
			
				7Fh	448.2mA (maximum current for assist light mode, mode_setting=10)
			
				9Ch	551mA - default setting
			
				FEh	896.5mA (996.1mA ¹ if current_boost=1)
FFh	900mA (1000mA ¹ if current_boost=1)				

1. Do not use [current_boost=1](#) for currents <= 900mA

Table 8. Current Set LED2 Register

Addr: 2		Current Set LED2 Register			
		This register defines LED Currents			
Bit	Bit Name	Default	Access	Description	
7:0	led_current2	9Ch	R/W	Define the current on pin LED_OUT2 in flash mode assist mode uses bits 6:0 of this current setting (max. half of full current setting) indicator or low current pwm mode uses only 5:0 of this current setting (max. 1/4 of full current setting)	
				0h	0mA
				1h	3.5mA
				2h	7.1mA
			
				3Fh	222.4mA (maximum current for indicator or low current pwm mode, mode_setting=01)
			
				7Fh	448.2mA (maximum current for assist light mode, mode_setting=10)
			
				9Ch	551mA - default
			
				FEh	896.5mA (996.1mA ¹ if current_boost=1)
FFh	900mA (1000mA ¹ if current_boost=1)				

1. Do not use [current_boost=1](#) for currents <= 900mA

Table 9. TXMask Register

Addr: 3		TXMask Register			
		This register defines the TXMask settings and coil peak current			
Bit	Bit Name	Default	Access	Description	
1:0	ext_torch_on	00	R/W	Defines operating mode for input pin TXMASK/TORCH	
				00	pin has no effect
				01	txmask-mode; during flash if TXMASK/TORCH=1, the LED current is set to flash_txmask_current - (see TXMASK on page 14)
				10	external torch mode: if TXMASK/TORCH=1 and mode_setting=00 , the AS3648 is set into external torch mode (LED current is defined by the 7LSB ¹ bits of led_current1 and led_current2)
				11	don't use
3:2	coil_peak	10	R/W	Defines the maximum coil current (parameter ILIMIT)	
				00	ILIMIT = 2.0A
				01	ILIMIT = 2.5A
				10	ILIMIT = 3.0A
				11	ILIMIT = 3.5A

Table 9. TXMask Register (Continued)

Addr: 3		TXMask Register			
This register defines the TXMask settings and coil peak current					
Bit	Bit Name	Default	Access	Description	
7:4	flash_txmask_current ²	6h	R/W	Define the current on pin LED_OUT1/2 in flash mode if <code>ext_torch_on=01</code> and <code>TXMASK/TORCH=1</code>	
				0h	0mA
				1h	57mA (62.7mA if <code>current_boost=1</code>)
				2h	113mA (125.5mA if <code>current_boost=1</code>)
				3h	169mA (188.2mA if <code>current_boost=1</code>)
				4h	226mA (251mA if <code>current_boost=1</code>)
				5h	282mA (313.7mA if <code>current_boost=1</code>)
				6h	339mA (376.5mA if <code>current_boost=1</code>)- default
				7h	395mA (439.2mA if <code>current_boost=1</code>)
				8h	452mA (502mA if <code>current_boost=1</code>)
				9h	508mA (564.7mA if <code>current_boost=1</code>)
				Ah	565mA (627.5mA if <code>current_boost=1</code>)
				Bh	621mA (690.2mA if <code>current_boost=1</code>)
				Ch	678mA (752.9mA if <code>current_boost=1</code>)
				Dh	734mA (815.7mA if <code>current_boost=1</code>)
				Eh	791mA (878.4mA if <code>current_boost=1</code>)
Fh	847mA (941.2mA if <code>current_boost=1</code>)				

1. The MSB bit of this register not used to protect the LED; therefore the maximum current = half the maximum flash current

2. If `current_boost=1`, the LED current is increased by 11%.

Table 10. Low Voltage Register

Addr: 4		Low Voltage Register			
This register defines the operating mode with low battery voltages					
Bit	Bit Name	Default	Access	Description	
2:0	vin_low_v_run	4h	R/W	Voltage level on VIN where current reduction triggers during operation (see Current Reduction by VIN measurements in Flash Mode on page 14) - only in flash mode; if VIN drops below this voltage during current ramp up, the current ramp up is stopped; during operation the current is decreased until the voltage on VIN rises above this threshold - fault_uvlo is set	
				0h	function is disabled
				1h	3.0V
				2h	3.07V
				3h	3.14V
				4h	3.22V - default
				5h	3.3V
				6h	3.38V
5:3	vin_low_v	5h	R/W	Voltage level on VIN where driver will change current before startup (only in flash mode) if before startup (out_on set from 0 to 1), the voltage on VIN is below vin_low_v , the current is changed to flash_txmask_current (vin_low_v_shutdown =0) or 0=shutdown (vin_low_v_shutdown =1) and fault_uvlo is set	
				0h	function is disabled
				1h	3.0V
				2h	3.07V
				3h	3.14V
				4h	3.22V
				5h	3.3V - default
				6h	3.38V
6	vin_low_v_shutdown	0	R/W	Enables Shutdown of current reduction under low voltage conditions	
				0	if before startup (out_on set from 0 to 1), the voltage on VIN is below vin_low_v , the current is changed to flash_txmask_current and fault_uvlo is set
7	const_v_mode	0	R/W	Enables Constant output voltage mode	
				0	Normal operation defined by mode_setting
				1	5V constant voltage mode on VOUT1/2; reset registers mode_setting , out_on and ext_torch_on before setting this bit

Table 11. Flash Timer Register

Addr: 5		Flash Timer Register			
		This register identifies the flash timer and timeout settings			
Bit	Bit Name	Default	Access	Description	
7:0	flash_timeout ¹	23h	R/W	Define the duration of the flash timer and timeout timer	
				0h	2ms
				1h	4ms
				2h	6ms
			
				23h	72ms - default
			
				7F	256ms
				80	264ms(now 8 ms LSB steps from here on) ²
				81	272ms
				82	280ms
			
				FEh	1272ms
FFh	1280ms				

1. At maximum output current the flash duration should be limited to 120ms to avoid overheating of the AS3648.

2. Internal calculation for codes above 80h: flash timeout [ms] = (flash_timeout-127) * 8 + 256 [ms]

Table 12. Control Register

Addr: 6		Control Register			
		This register identifies the operating mode and includes an all on/off bit			
Bit	Bit Name	Default	Access	Description	
1:0	mode_setting	00	R/W	Define the AS3648 operating mode	
				00	external torch mode if <code>ext_torch_on</code> (page 23)=10
				01	indicator mode (or low current mode using PWM) LED current is defined by the 6LSB bits of <code>led_current1</code> and <code>led_current2</code> pwm modulated with 31.5kHz defined by register <code>inct_pwm</code> (1/16...4/16)
				10	assist light mode: LED current is defined by the 7LSB ¹ bits of <code>led_current1</code> and <code>led_current2</code>
2	reserved	X	R	flash mode: LED current is defined by <code>led_current1</code> and <code>led_current2</code> (<code>out_on</code> and <code>mode_setting</code> are automatically cleared after a flash pulse)	
				reserved - don't use, always write 0	

Table 12. Control Register (Continued)

Addr: 6		Control Register			
This register identifies the operating mode and includes an all on/off bit					
Bit	Bit Name	Default	Access	Description	
3	out_on	0	R/W	Enables the output current sinks (pin LED_OUT1/2)	
				0	outputs disabled
				1	outputs enabled (out_on and mode_setting are automatically cleared after a flash pulse)

1. The MSB bit of this register not used to protect the LED; therefore the maximum assist light current = half the maximum flash current

Table 13. Strobe Signalling Register

Addr: 7		Strobe Signalling Register			
This register defines the flash current reducing and mode for STROBE					
Bit	Bit Name	Default	Access	Description	
6	strobe_type	1	R/W	Defines if the STROBE input is edge or level sensitive; see also bit strobe_on (page 27)	
				0	STROBE input is edge sensitive
				1	STROBE input is level sensitive
7	strobe_on	1	R/W	Enables the STROBE input	
				0	STROBE input disabled
				1	STROBE input enabled in flash mode

Table 14. Fault Register

Addr: 8		Fault Register			
This register identifies all the different fault conditions and provide information about the LED detection					
Bit	Bit Name	Default	Access	Description	
0	fault_uvlo	0	R/sC ¹	an undervoltage event has happened - see Current Reduction by VIN measurements in Flash Mode on page 14	
				0	No
				1	Yes
1	reserved	0	R	reserved - don't use	
2	reserved	0	R	reserved - don't use	
3	fault_txmask	0	R/sC ¹	TXMASK/TORCH event triggered during flash - see TXMASK event occurred on page 12	
				0	No
				1	Yes
4	fault_timeout	0	R/sC ¹	see Flash Timeout on page 12	
				0	No fault
				1	Flash timeout exceeded

Table 14. *Fault Register (Continued)*

Addr: 8		Fault Register			
		This register identifies all the different fault conditions and provide information about the LED detection			
Bit	Bit Name	Default	Access	Description	
5	fault_overtemp	0	R/sC ¹	see After the startup of the DCDC converter, the voltage on LED_OUT1/2 is continuously monitored and compared against VLEDSHORT if the LED current is above 14mA (current_boost=0), 15.6mA (current_boost=1)(see Figure 25). If the voltage across the LED (VFLED = VOUT1/2-LED_OUT1/2) stays below VLEDSHORT, the DCDC is stopped (as a shorted LED is assumed), the current sinks are disabled and the bit fault_led_short (see page 28) is set. In a dual LED configuration for the AS3648, if a single shorted LED is detected, this LED is disabled and the device continuous operation with the other LED. on page 12	
				0	No fault
				1	Junction temperature limit has been exceeded
6	fault_led_short	0	R/sC ¹	see Short Circuit Protection on page 12	
				0	No fault
				1	A shorted LED is detected (pin LED_OUT1/2)
7	fault_ovp	0	R/sC ¹	see Overvoltage Protection on page 11	
				0	No fault
				1	An overvoltage condition is detected (pin VOUT)

1. R/sC = Read, self clear; after readout the register is automatically cleared

Table 15. *PWM and Indicator Register*

Addr: 9		PWM and Indicator Register			
		This register defines the PWM mode (e.g. for indicator) and 4/1MHz mode switching			
Bit	Bit Name	Default	Access	Description	
1:0	inct_pwm	00	R/W	Define the AS3648 PWM with 31.5kHz operation for indicator or low current mode (mode_setting=00)	
				00	1/16 duty cycle
				01	2/16 duty cycle
				10	3/16 duty cycle
				11	4/16 duty cycle
2	freq_switch_on	0	R/W	Exact frequency switching between 4MHz/1MHz for assist and flash modes for operation close to maximum pulsewidth	
				0	Pulseskip operation is allowed for all modes - results in better efficiency
				1	In flash and assist light mode (indicator mode or low current mode using PWM always will use pulseskip) if led_current1>=40h and led_current2>=40h and current_boost=0, the DCDC is running at 4MHz or 1MHz (pulseskip is disabled) - results in improved noise performance;

Table 15. *PWM and Indicator Register (Continued)*

Addr: 9		PWM and Indicator Register			
This register defines the PWM mode (e.g. for indicator) and 4/1MHz mode switching					
Bit	Bit Name	Default	Access	Description	
3	led_out1above2	0	R	Measure the voltage difference between LED_OUT1 vs.LED_OUT2 during operation of the DCDC	
				0	
4	led_out2above1	0	R	Measure the voltage difference between LED_OUT1 vs.LED_OUT2 during operation of the DCDC	
				1	$V(\text{LED_OUT1}) > V(\text{LED_OUT2}) + \sqrt{V(\text{LED_OUTCOMP_HYST})}$
5	load_balance_on	0	R/W	Balance the current sinks (up to +/-10% of set current) to improve application efficiency for unmatched LED forward voltages - see Load Balancing on page 17	
				0	disabled
				1	enabled

Table 17. *Minimum LED Current Register*

Addr: Eh		Minimum LED Current Register		
This register reports the minimum LED current from the last operation cycle				
Bit	Bit Name	Default	Access	Description
7:0	led_current_min ¹²³	00h	R	Minimum current through the current sink (only including all current reductions as described in Current Reduction by VIN measurements in Flash Mode excluding current reductions caused by TXMASK)

1. Only the current through LED_OUT1 is reported.
2. As the internal change of this register is asynchronous to the readout, it is recommended to readout the register after the flash pulse. The register will store the minimum current through the LED after e.g. a previous flash. This current can be used for a subsequent flash pulse for a safe operating range.
3. This register is only set if an actual current reduction happens ([fault_uvlo](#) (see [page 27](#))=1) otherwise [led_current_min](#)=0.

Table 18. *Actual LED Current Register*

Addr: Fh		Actual LED Current Register		
This register reports the actual set LED current				
Bit	Bit Name	Default	Access	Description
7:0	led_current_actual ¹²	00h	R	Actual set current through the current sink (including all current reductions as described in Flash Current Reductions including LED current ramp up/down)

1. Only the current through LED_OUT1 is reported.
2. As the internal change of this register is asynchronous to the readout, it is recommended to readout the register twice and compare the results.

Table 19. Password Register Register

Addr: 80h		Password Register Register			
		Password Protection for register Current Boost			
Bit	Bit Name	Default	Access	Description	
7:0	password	NA	W	Write A1h into this register to enable access to register 81h	

Table 20. Current Boost Register

Addr: 81h		Current Boost Register			
		Increase output current by 11%			
Bit	Bit Name	Default	Access	Description	
0	current_boost ¹	0	R/W	Boost all LED currents by 11%	
				0	all LED current are as described in the tables
				1	all LED current are increased by 11%

1. Write A1h into register `password` (0x80) to enable access to this register (password unlocking is only valid for a single I²C access) - required on any read or write access to this register

Register Map

Table 21. Register Map¹

Register Definition	Addr	Default	Content								
			b7	b6	b5	b4	b3	b2	b1	b0	
ChipID	0	Bxh	fixed_id				version				
Current Set LED1	1	9Ch	led_current1								
Current Set LED2	2	9Ch	led_current2								
TXMask	3	68h	flash_txmask_current				coil_peak		ext_torch_on		
Low Voltage	4	2Ch	const_v_mode	vin_low_v_shut_down	vin_low_v			vin_low_v_run			
Flash Timer	5	23h	flash_timeout								
Control	6	00h					out_on	reserve_d	mode_setting		
Strobe Signalling	7	C0h	strobe_on	strobe_type

PWM and Indicator	9	00h			load_balance_on	led_out2above1	led_out1above2	freq_switch_on	inct_pwm		
Minimum LED Current	Eh	00h	led_current_min								
Actual LED Current	Fh	00h	led_current_actual								
Password Register	80h	00h	password								
Current Boost	81h	00h									current_boost

1. Always write '0' to undefined register bits (e.g. to bits 4..7 of register 6)

9 Application Information

External Components

Input Capacitor C_{VIN}

Low ESR input capacitors reduce input switching noise and reduce the peak current drawn from the battery. Ceramic capacitors are required for input decoupling and should be located as close to the device as is practical.

Table 22. Recommended Input Capacitor

Part Number	C	TC Code	Rated Voltage	Size	Manufacturer
GRM188R60J106ME47	10 μ >3 μ F@4.5V >2 μ F@5.25V	X5R	6V3	0603	Murata www.murata.com
LMK107BBJ106MA	10 μ >3 μ F@4.5V	X5R	6V3	0603	Taiyo Yuden www.t-yuden.com

If a different input capacitor is chosen, ensure similar ESR value and at least 3 μ F capacitance at the maximum input supply voltage. Larger capacitor values (C) may be used without limitations.

Add a smaller capacitor in parallel to the input pin VIN (e.g. Murata GRM155R61C104, >50nF @ 3V, 0402 size).

Output Capacitor C_{VOUT}

Low ESR capacitors should be used to minimize VOUT ripple. Multi-layer ceramic capacitors are recommended since they have extremely low ESR and are available in small footprints. The capacitor should be located as close to the device as is practical.

X5R dielectric material is recommended due to their ability to maintain capacitance over wide voltage and temperature range.

Table 23. Recommended Output Capacitor

Part Number	C	TC Code	ESR	Rated Voltage	Size	Manufacturer
GRM219R61A116U	10 μ F +/-10% >4.2 μ F@5V	X5R	30m Ω	10V	0805	Murata www.murata.com

If a different output capacitor is chosen, ensure similar ESR values and at least 4.2 μ F capacitance at 5V output voltage.

Inductor L_{DCDC}

The fast switching frequency (4MHz) of the AS3648 allows for the use of small SMDs for the external inductor. The saturation current $I_{SATURATION}$ should be chosen to be above the maximum value of I_{LIMIT}^{11} . The inductor should have very low DC resistance (DCR) to reduce the I^2R power losses - high DCR values will reduce efficiency.

Table 24. Recommended Inductor

Part Number	L	DCR	$I_{SATURATION}$	Size	Manufacturer
C3-P1.5R	1.5 μ H	58m Ω	2.4A@25°C, 2.0A ¹	3x3x1.5mm (height is max.)	Mitsumi www.mitsumi.com

11. Can be adjusted in I^2C mode with register [coil_peak](#) (see page 23)

Table 24. Recommended Inductor (Continued)

Part Number	L	DCR	ISATURATION	Size	Manufacturer
LQM32PN1R0MG0	1.0µH >0.6µH @ 3.0A	60mΩ	3.0A ²	3.2x2.5x0.9 mm max 1.0mm height	Murata www.murata.com
LQM2HPN1R0MGC	1.0µH >0.6µH @ 2.0A	100mΩ	1.5A (2.0A) ³	2.5x2.0x0.9 mm max 1.0mm height	
CIG32W1R0MNE	1.0µH >0.7µH @ 2.7A >0.6µH @ 3.0A	60mΩ +/-25%	3.0A	3.2x2.5mm max 1.0mm height	Samsung Electro- Mechanics www.sem.samsung.co.kr
NRH2412T1R0N	1.0µH >0.6µH @ 2.5A	77mΩ	2.5A ⁴	2.4x2.4x1.2 mm (height is max.)	Taiyo Yuden www.t-yuden.com
CKP3225N1R0M	1.0µH >0.6µH @ 3.0A	<60mΩ	3.0A ⁵	3.2x2.5x0.9 mm max 1.0mm height	Taiyo Yuden www.t-yuden.com

1. Do not exceed maximum ISATURATION - can be ensured by setting `coil_peak` (will limit LED current)
2. Flash pattern: 200ms/3A, 200ms pause, 200ms/3A, 2s then repeat again (no limit on the number of total cycles)
Alternative pattern with 1000ms/1.6A, 200ms pause, 200ms/3A, 200ms pause, 200ms/3A, 2s then repeat again. (no limit on the number of total cycles)
3. Set current limit to 2A (`coil_peak=00b`) - will limit maximum output current.
Flash cycle limit: 150ms on, 500ms off; repeat maximum 50 times.
4. Set current limit to 2.5A (`coil_peak=01b`) - will limit maximum output current.
5. Check with coil supplier for worst case flash pattern.

If a different inductor is chosen, ensure similar DCR values and at least 0.6µH inductance at `LIMIT`.

PCB Layout Guideline

The high speed operation requires proper layout for optimum performance. Route the power traces first and try to minimize the area and wire length of the two high frequency/high current loops:

Loop1: CVIN/CVIN2 - LDCDC - pin SW1/2 - pin GND - CVIN/CVIN2

Loop2: CVIN/CVIN2 - LDCDC - pin SW1/2 - pin VOUT1/2 - CVOUT - pin GND - CVIN/CVIN2

At the pin GND a single via (or more vias, which are closely combined) connects to the common ground plane. This via(s) will isolate the DCDC high frequency currents from the common ground (as most high frequency current will flow between Loop1 and Loop2 and will not pass the ground plane) - see the 'island' in [Figure 32](#).

Figure 32. Layout recommendation

Note: If component placement rules allow, move all components close to the AS3648 to reduce the area and length of Loop1 and Loop2.

An additional 100nF (e.g. Murata GRM155R61C104, >50nF @ 3V, 0402 size) capacitor CVIN2 in parallel to CVIN is recommended to filter high frequency noise for the power supply of AS3648. This capacitor should be as close as possible to the GND/VIN pins of AS3648.

5V Operating Mode

The AS3648 can be used to power a 5V system (e.g. audio amplifier). The operating mode is selected by setting register bit `const_v_mode` (page 25)=1. In this operating mode, the current sinks are disabled and cannot be switched on (no flash/torch operation is possible).

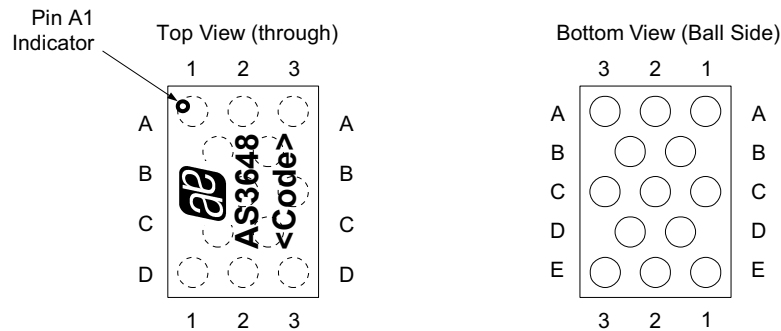

Note: There is always a diode between VIN and VOUT1/2 due to the internal circuit. Therefore VOUT1/2 cannot be completely switched off

The coplanarity of the balls is 40µm.

11 Ordering Information

The devices are available as the standard products shown in [Table 25](#).

Table 25. Ordering Information

Model	Description	Delivery Form	Package
AS3648-ZWLT	2000mA High Current LED Flash Driver	Tape & Reel	13-pin WL-CSP (2.25x1.5x0.5mm) 0.5mm pitch RoHS compliant / Pb-Free / Green

Note: All products are RoHS compliant and austriamicrosystems green.

Buy our products or get free samples online at ICdirect: <http://www.austriamicrosystems.com/ICdirect>
