## 72Mb Flow Through Synchronous NBT SRAM

**6.5 ns–8.0 ns**  
**1.8 V or 2.5 V V<sub>DD</sub>**  
**1.8 V or 2.5 V I/O**

### Features

- NBT (No Bus Turn Around) functionality allows zero wait read-write-read bus utilization; Fully pin-compatible with flow through NtRAM™, NoBL™ and ZBT™ SRAMs
- 1.8 V or 2.5 V core power supply
- 1.8 V or 2.5 V I/O supply
- $\overline{\text{LBO}}$  pin for Linear or Interleave Burst mode
- Pin compatible with 4Mb, 9Mb, 18Mb and 36Mb devices
- Byte write operation (9-bit Bytes)
- 3 chip enable signals for easy depth expansion
- ZZ Pin for automatic power-down
- JEDEC-standard 100-lead TQFP package
- RoHS-compliant 100-lead TQFP package available

### Functional Description

The GS8640FZ18/36T-xxxV is a 72Mbit Synchronous Static SRAM. GSI's NBT SRAMs, like ZBT, NtRAM, NoBL or other flow through read/single late write SRAMs, allow

utilization of all available bus bandwidth by eliminating the need to insert deselect cycles when the device is switched from read to write cycles.

Because it is a synchronous device, address, data inputs, and read/ write control inputs are captured on the rising edge of the input clock. Burst order control ( $\overline{\text{LBO}}$ ) must be tied to a power rail for proper operation. Asynchronous inputs include the Sleep mode enable (ZZ) and Output Enable. Output Enable can be used to override the synchronous control of the output drivers and turn the RAM's output drivers off at any time. Write cycles are internally self-timed and initiated by the rising edge of the clock input. This feature eliminates complex off-chip write pulse generation required by asynchronous SRAMs and simplifies input signal timing.

The GS8640FZ18/36T-xxxV is implemented with GSI's high performance CMOS technology and is available in a JEDEC-standard 100-pin TQFP package.

### Parameter Synopsis

|                                       |                | -6.5 | -7.5 | -8.0 | Unit |

GS8640FZ18/36T-xxxV NBT SRAM Functional Block Diagram

## Functional Details

### Clocking

Deassertion of the Clock Enable ( $\overline{\text{CKE}}$ ) input blocks the Clock input from reaching the RAM's internal circuits. It may be used to suspend RAM operations. Failure to observe Clock Enable set-up or hold requirements will result in erratic operation.

### Flow Through Mode Read and Write Operations

Operation of the RAM in Flow Through mode is very similar to operations in Pipeline mode. Activation of a Read Cycle and the use of the Burst Address Counter is identical. In Flow Through mode the device may begin driving out new data immediately after new address are clocked into the RAM, rather than holding new data until the following (second) clock edge. Therefore, in Flow Through mode the read pipeline is one cycle shorter than in Pipeline mode.

| Function        | $\overline{\text{W}}$ | $\overline{\text{BA}}$ | $\overline{\text{BB}}$ | $\overline{\text{BC}}$ | $\overline{\text{BD}}$ |
|-----------------|-----------------------|------------------------|------------------------|------------------------|------------------------|
| Read            | H                     | X                      | X                      | X                      | X                      |
| Write Byte "a"  | L                     | L                      | H                      | H                      | H                      |
| Write Byte "b"  | L                     | H                      | L                      | H                      | H                      |
| Write Byte "c"  | L                     | H                      | H                      | L                      | H                      |
| Write Byte "d"  | L                     | H                      | H                      | H                      | L                      |
| Write all Bytes | L                     | L                      | L                      | L                      | L                      |
| Write Abort/NOP | L                     | H                      | H                      | H                      | H                      |

Write operations are initiated in the same way, but differ in that the write pipeline is one cycle shorter as well, preserving the ability to turn the bus from reads to writes without inserting any dead cycles. While the pipelined NBT RAMs implement a double late write protocol, in Flow Through mode a single late write protocol mode is observed. Therefore, in Flow Through mode, address and control are registered on the first rising edge of clock and data in is required at the data input pins at the second rising edge of clock.

### Notes:

1. Continue Burst cycles, whether read or write, use the same control inputs. A Deselect continue cycle can only be entered into if a Deselect cycle is executed first.
2. Dummy Read and Write abort can be considered NOPs because the SRAM performs no operation. A Write abort occurs when the  $\overline{\text{W}}$  pin is sampled low but no Byte Write pins are active so no write operation is performed.
3.  $\overline{\text{G}}$  can be wired low to minimize the number of control signals provided to the SRAM. Output drivers will automatically turn off during write cycles.
4. If  $\overline{\text{CKE}}$  High occurs during a pipelined read cycle, the DQ bus will remain active (Low Z). If  $\overline{\text{CKE}}$  High occurs during a write cycle, the bus will remain in High Z.
5. X = Don't Care; H = Logic High; L = Logic Low;  $\overline{\text{Bx}}$  = High = All Byte Write signals are high;  $\overline{\text{Bx}}$  = Low = One or more Byte/Write signals are Low
6. All inputs, except  $\overline{\text{G}}$  and ZZ must meet setup and hold times of rising clock edge.
7. Wait states can be inserted by setting  $\overline{\text{CKE}}$  high.
8. This device contains circuitry that ensures all outputs are in High Z during power-up.
9. A 2-bit burst counter is incorporated.
10. The address counter is incremented for all Burst continue cycles.

## Flow Through Mode Data I/O State Diagram

### Key

### Notes

1. The Hold command ( $\overline{\text{CKE}}$  Low) is not shown because it prevents any state change.
2. W, R, B and D represent input command codes as indicated in the Truth Tables.

## Current State and Next State Definition for: Pipeline and Flow Through Read Write Control State Diagram

### Burst Cycles

Although NBT RAMs are designed to sustain 100% bus bandwidth by eliminating turnaround cycle when there is transition from read to write, multiple back-to-back reads or writes may also be performed. NBT SRAMs provide an on-chip burst address generator that can be utilized, if desired, to further simplify burst read or write implementations. The ADV control pin, when driven high, commands the SRAM to advance the internal address counter and use the counter generated address to read or write the SRAM. The starting address for the first cycle in a burst cycle series is loaded into the SRAM by driving the ADV pin low, into Load mode.

### Burst Order

The burst address counter wraps around to its initial state after four addresses (the loaded address and three more) have been accessed. The burst sequence is determined by the state of the Linear Burst Order pin ( $\overline{\text{LBO}}$ ). When this pin is low, a linear burst sequence is selected. When the RAM is installed with the LBO pin tied high, Interleaved burst sequence is selected. See the tables below for details.

### Mode Pin Functions

| Mode Name           | Pin Name                | State   | Function                   |
|---------------------|-------------------------|---------|----------------------------|
| Burst Order Control | $\overline{\text{LBO}}$ | L       | Linear Burst               |
|                     |                         | H       | Interleaved Burst          |
| Power Down Control  | ZZ                      | L or NC | Active                     |
|                     |                         | H       | Standby, $I_{DD} = I_{SB}$ |

**Note:**

There is a pull-down device on the ZZ pin, so this input pin can be unconnected and the chip will operate in the default states as specified in the above tables.

### Burst Counter Sequences

#### Linear Burst Sequence

|             | A[1:0] | A[1:0] | A[1:0] | A[1:0] |
|-------------|--------|--------|--------|--------|
| 1st address | 00     | 01     | 10     | 11     |
| 2nd address | 01     | 10     | 11     | 00     |
| 3rd address | 10     | 11     | 00     | 01     |
| 4th address | 11     | 00     | 01     | 10     |

**Note:**

The burst counter wraps to initial state on the 5th clock.

#### Interleaved Burst Sequence

|             | A[1:0] | A[1:0] | A[1:0] | A[1:0] |
|-------------|--------|--------|--------|--------|
| 1st address | 00     | 01     | 10     | 11     |
| 2nd address | 01     | 00     | 11     | 10     |
| 3rd address | 10     | 11     | 00     | 01     |
| 4th address | 11     | 10     | 01     | 00     |

**Note:**

The burst counter wraps to initial state on the 5th clock.

BPR 1999.05.18

### Sleep Mode

During normal operation, ZZ must be pulled low, either by the user or by its internal pull down resistor. When ZZ is pulled high, the SRAM will enter a Power Sleep mode after 2 cycles. At this time, internal state of the SRAM is preserved. When ZZ returns to low, the SRAM operates normally after 2 cycles of wake up time.

Sleep mode is a low current, power-down mode in which the device is deselected and current is reduced to  $I_{SB2}$ . The duration of Sleep mode is dictated by the length of time the ZZ is in a high state. After entering Sleep mode, all inputs except ZZ become disabled and all outputs go to High-Z. The ZZ pin is an asynchronous, active high input that causes the device to enter Sleep mode. When the ZZ pin is driven high,  $I_{SB2}$  is guaranteed after the time  $t_{ZZI}$  is met. Because ZZ is an asynchronous input, pending operations or operations in progress may not be properly completed if ZZ is asserted. Therefore, Sleep mode must not be initiated until valid pending operations are completed. Similarly, when exiting Sleep mode during  $t_{ZZR}$ , only a deselect or read commands may be applied while the SRAM is recovering from Sleep mode.

**Sleep Mode Timing Diagram**

## Absolute Maximum Ratings

(All voltages reference to  $V_{SS}$ )

| Symbol     | Description                   | Value                                        | Unit |
|------------|-------------------------------|----------------------------------------------|------|
| $V_{DD}$   | Voltage on $V_{DD}$ Pins      | -0.5 to 4.6                                  | V    |
| $V_{DDQ}$  | Voltage on $V_{DDQ}$ Pins     | -0.5 to $V_{DD}$                             | V    |
| $V_{I/O}$  | Voltage on I/O Pins           | -0.5 to $V_{DDQ} + 0.5$ ( $\leq 4.6$ V max.) | V    |
| $V_{IN}$   | Voltage on Other Input Pins   | -0.5 to $V_{DD} + 0.5$ ( $\leq 4.6$ V max.)  | V    |
| $I_{IN}$   | Input Current on Any Pin      | +/-20                                        | mA   |
| $I_{OUT}$  | Output Current on Any I/O Pin | +/-20                                        | mA   |
| $P_D$      | Package Power Dissipation     | 1.5                                          | W    |
| $T_{STG}$  | Storage Temperature           | -55 to 125                                   | °C   |
| $T_{BIAS}$ | Temperature Under Bias        | -55 to 125                                   | °C   |

### Note:

Permanent damage to the device may occur if the Absolute Maximum Ratings are exceeded. Operation should be restricted to Recommended Operating Conditions. Exposure to conditions exceeding the Absolute Maximum Ratings, for an extended period of time, may affect reliability of this component.

## Power Supply Voltage Ranges (1.8 V/2.5 V Version)

| Parameter                          | Symbol     | Min. | Typ. | Max.     | Unit | Notes |
|------------------------------------|------------|------|------|----------|------|-------|
| 1.8 V Supply Voltage               | $V_{DD1}$  | 1.7  | 1.8  | 2.0      | V    |       |
| 2.5 V Supply Voltage               | $V_{DD2}$  | 2.3  | 2.5  | 2.7      | V    |       |
| 1.8 V $V_{DDQ}$ I/O Supply Voltage | $V_{DDQ1}$ | 1.7  | 1.8  | $V_{DD}$ | V    |       |
| 2.5 V $V_{DDQ}$ I/O Supply Voltage | $V_{DDQ2}$ | 2.3  | 2.5  | $V_{DD}$ | V    |       |

### Notes:

- The part numbers of Industrial Temperature Range versions end the character "I". Unless otherwise noted, all performance specifications quoted are evaluated for worst case in the temperature range marked on the device.
- Input Under/overshoot voltage must be  $-2\text{ V} > V_i < V_{DDn} + 2\text{ V}$  not to exceed 4.6 V maximum, with a pulse width not to exceed 20% tKC.

## V<sub>DDQ2</sub> & V<sub>DDQ1</sub> Range Logic Levels

| Parameter                          | Symbol          | Min.                | Typ. | Max.                  | Unit | Notes |
|------------------------------------|-----------------|---------------------|------|-----------------------|------|-------|
| V <sub>DD</sub> Input High Voltage | V <sub>IH</sub> | 0.6*V <sub>DD</sub> | —    | V <sub>DD</sub> + 0.3 | V    | 1     |
| V <sub>DD</sub> Input Low Voltage  | V <sub>IL</sub> | −0.3                | —    | 0.3*V <sub>DD</sub>   | V    | 1     |

### Notes:

- The part numbers of Industrial Temperature Range versions end the character "I". Unless otherwise noted, all performance specifications quoted are evaluated for worst case in the temperature range marked on the device.
- Input Under/overshoot voltage must be  $-2\text{ V} > V_i < V_{DDn} + 2\text{ V}$  not to exceed 4.6 V maximum, with a pulse width not to exceed 20% t<sub>KC</sub>.

## Recommended Operating Temperatures

| Parameter                                       | Symbol         | Min. | Typ. | Max. | Unit | Notes |
|-------------------------------------------------|----------------|------|------|------|------|-------|
| Ambient Temperature (Commercial Range Versions) | T <sub>A</sub> | 0    | 25   | 70   | °C   | 2     |
| Ambient Temperature (Industrial Range Versions) | T <sub>A</sub> | −40  | 25   | 85   | °C   | 2     |

### Notes:

- The part numbers of Industrial Temperature Range versions end the character "I". Unless otherwise noted, all performance specifications quoted are evaluated for worst case in the temperature range marked on the device.
- Input Under/overshoot voltage must be  $-2\text{ V} > V_i < V_{DDn} + 2\text{ V}$  not to exceed 4.6 V maximum, with a pulse width not to exceed 20% t<sub>KC</sub>.

## Undershoot Measurement and Timing

## Overshoot Measurement and Timing

## Capacitance

(T<sub>A</sub> = 25°C, f = 1 MHz, V<sub>DD</sub> = 2.5 V)

| Parameter                | Symbol           | Test conditions        | Typ. | Max. | Unit |
|--------------------------|------------------|------------------------|------|------|------|
| Input Capacitance        | C <sub>IN</sub>  | V <sub>IN</sub> = 0 V  | 8    | 10   | pF   |
| Input/Output Capacitance | C <sub>I/O</sub> | V <sub>OUT</sub> = 0 V | 12   | 14   | pF   |

### Note:

These parameters are sample tested.

## AC Test Conditions

| Parameter              | Conditions              |
|------------------------|-------------------------|
| Input high level       | $V_{DD} - 0.2\text{ V}$ |
| Input low level        | 0.2 V                   |
| Input slew rate        | 1 V/ns                  |
| Input reference level  | $V_{DD}/2$              |
| Output reference level | $V_{DDQ}/2$             |
| Output load            | Fig. 1                  |

### Notes:

1. Include scope and jig capacitance.
2. Test conditions as specified with output loading as shown in Fig. 1 unless otherwise noted.
3. Device is deselected as defined by the Truth Table.

## DC Electrical Characteristics

| Parameter                                | Symbol   | Test Conditions                                | Min                | Max               |
|------------------------------------------|----------|------------------------------------------------|--------------------|-------------------|
| Input Leakage Current (except mode pins) | $I_{IL}$ | $V_{IN} = 0\text{ to }V_{DD}$                  | -1 $\mu\text{A}$   | 1 $\mu\text{A}$   |
| $\overline{FT}$ , ZZ Input Current       | $I_{IN}$ | $V_{DD} \geq V_{IN} \geq 0\text{ V}$           | -100 $\mu\text{A}$ | 100 $\mu\text{A}$ |
| Output Leakage Current                   | $I_{OL}$ | Output Disable, $V_{OUT} = 0\text{ to }V_{DD}$ | -1 $\mu\text{A}$   | 1 $\mu\text{A}$   |

## DC Output Characteristics (1.8 V/2.5 V Version)

| Parameter                 | Symbol    | Test Conditions                                      | Min                      | Max   |
|---------------------------|-----------|------------------------------------------------------|--------------------------|-------|
| 1.8 V Output High Voltage | $V_{OH1}$ | $I_{OH} = -4\text{ mA}$ , $V_{DDQ} = 1.7\text{ V}$   | $V_{DDQ} - 0.4\text{ V}$ | —     |
| 2.5 V Output High Voltage | $V_{OH2}$ | $I_{OH} = -8\text{ mA}$ , $V_{DDQ} = 2.375\text{ V}$ | 1.7 V                    | —     |
| 1.8 V Output Low Voltage  | $V_{OL1}$ | $I_{OL} = 4\text{ mA}$                               | —                        | 0.4 V |
| 2.5 V Output Low Voltage  | $V_{OL2}$ | $I_{OL} = 8\text{ mA}$                               | —                        | 0.4 V |

**Operating Currents**

| 4M x 18 | GS8640FZ18GT-6.5IV       | NBT  | 1.8 V or 2.5 V | RoHS-compliant TQFP | 6.5                            | I                           | PQ                  |
| 4M x 18 | GS8640FZ18GT-7.5IV       | NBT  | 1.8 V or 2.5 V | RoHS-compliant TQFP | 7.5                            | I                           | PQ                  |
| 4M x 18 | GS8640FZ18GT-8IV         | NBT  | 1.8 V or 2.5 V | RoHS-compliant TQFP | 8                              | I                           | PQ                  |
| 2M x 36 | GS8640FZ36GT-6.5IV       | NBT  | 1.8 V or 2.5 V | RoHS-compliant TQFP | 6.5                            | I                           | PQ                  |
| 2M x 36 | GS8640FZ36GT-7.5IV       | NBT  | 1.8 V or 2.5 V | RoHS-compliant TQFP | 7.5                            | I                           | PQ                  |
| 2M x 36 | GS8640FZ36GT-8IV         | NBT  | 1.8 V or 2.5 V | RoHS-compliant TQFP | 8                              | I                           | PQ                  |

**Notes:**

- Customers requiring delivery in Tape and Reel should add the character "T" to the end of the part number. Example: GS8640FZ36T-8IVT.
- The speed column indicates the latency (ns) in Flow Through mode.
- T<sub>A</sub> = C = Commercial Temperature Range. T<sub>A</sub> = I = Industrial Temperature Range.
- PQ = Pre-Qualification.
- GSI offers other versions this type of device in many different configurations and with a variety of different features, only some of which are covered in this data sheet. See the GSI Technology web site ([www.gsistechnology.com](http://www.gsistechnology.com)) for a complete listing of current offerings
