215MHz, Rail-to-Rail Output, 1.1nV/√Hz, 3.5mA Op Amp Family

FEATURES

- **Low Noise Voltage: 1.1nV/√Hz**
- **Low Supply Current: 3.5mA/Amp Max**
- **Low Offset Voltage: 350μV Max**
- Gain Bandwidth Product:
  LT6230: 215MHz; $A_V \geq 1$
  LT6230-10: 1450MHz; $A_V \geq 10$
- Wide Supply Range: 3V to 12.6V
- Output Swings Rail-to-Rail
- Common Mode Rejection Ratio: 115dB Typ
- Output Current: 30mA
- Operating Temperature Range: –40°C to 85°C
- LT6230 Shutdown to 10μA Maximum
- LT6230/LT6230-10 in a Low Profile (1mm) ThinSOT™ Package
- Dual LT6231 in 8-Pin SO and Tiny DFN Packages
- LT6232 in a 16-Pin SSOP Package

APPLICATIONS

- Ultrasound Amplifiers
- Low Noise, Low Power Signal Processing
- Active Filters
- Driving A/D Converters
- Rail-to-Rail Buffer Amplifiers

DESCRIPTION

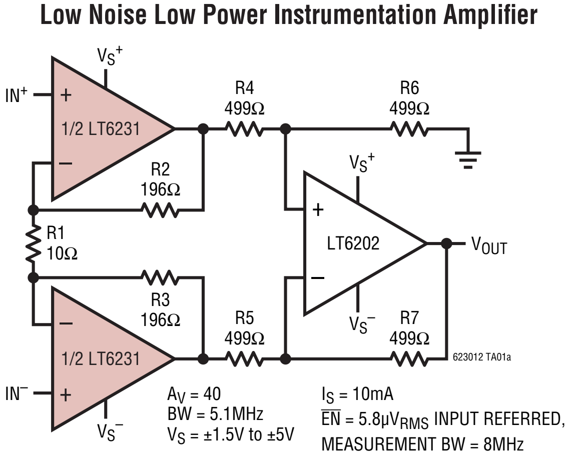
The LT®6230/LT6231/LT6232 are single/dual/quad low noise, rail-to-rail output unity-gain stable op amps that feature 1.1nV/√Hz noise voltage and draw only 3.5mA of supply current per amplifier. These amplifiers combine very low noise and supply current with a 215MHz gain-bandwidth product, a 70V/μs slew rate and are optimized for low supply voltage signal conditioning systems. The LT6230-10 is a single amplifier optimized for higher gain applications resulting in higher gain bandwidth and slew rate. The LT6230 and LT6230-10 include an enable pin that can be used to reduce the supply current to less than 10μA.

The amplifier family has an output that swings within 50mV of either supply rail to maximize the signal dynamic range in low supply applications and is specified on 3.3V, 5V and ±5V supplies. The $e_n \bullet \sqrt{I_{SUPPLY}}$ product of 1.9 per amplifier is among the most noise efficient of any op amp.

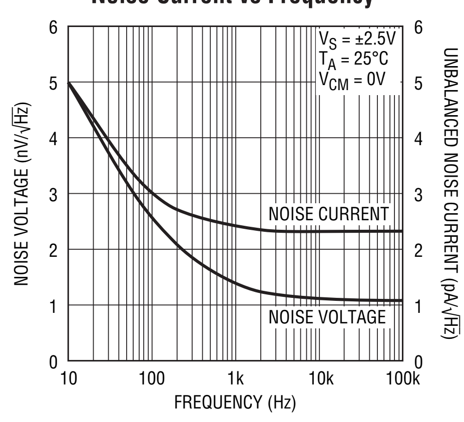
The LT6230/LT6230-10 are available in the 6-lead SOT-23 package and the LT6231 dual is available in the 8-pin SO package with standard pinouts. For compact layouts, the dual is also available in a tiny dual fine pitch leadless package (DFN). The LT6232 is available in the 16-pin SSOP package.

TYPICAL APPLICATION

Low Noise Low Power Instrumentation Amplifier



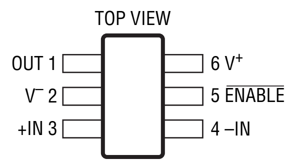
Noise Voltage and Unbalanced Noise Current vs Frequency



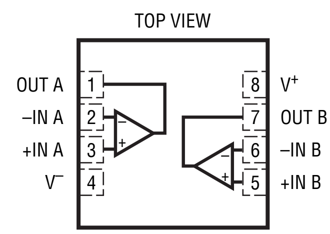
ABSOLUTE MAXIMUM RATINGS (Note 1)

Total Supply Voltage (V^+ to V^-) 12.6V
Input Current (Note 2).. ±40mA
Output Short-Circuit Duration (Note 3) .... Indefinite
Operating Temperature Range (Note 4).... –40°C to 85°C
Specified Temperature Range (Note 5) .... –40°C to 85°C
Junction Temperature .... 150°C
Junction Temperature (DD Package).................... 125°C
Storage Temperature Range .... –65°C to 150°C
Storage Temperature Range
(DD Package) .... –65°C to 125°C
Lead Temperature (Soldering, 10 sec)................... 300°C

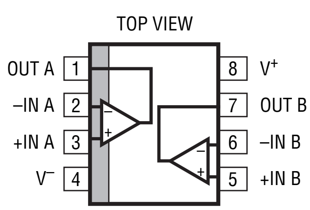
PIN CONFIGURATION



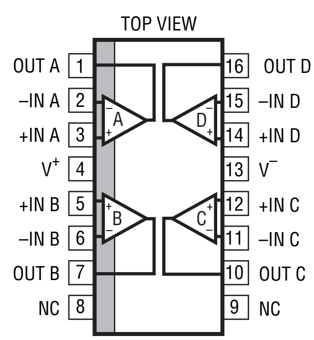
S6 PACKAGE
6-LEAD PLASTIC TSOT-23
T_{JMAX} = 150°C, θ_{JA} = 250°C/W



DD PACKAGE
8-LEAD (3mm × 3mm) PLASTIC DFN
T_{JMAX} = 125°C, θ_{JA} = 160°C/W
UNDERSIDE METAL CONNECTED TO V– (PCB CONNECTION OPTIONAL)



S8 PACKAGE
8-LEAD PLASTIC SO
T_{JMAX} = 150°C, θ_{JA} = 200°C/W



GN PACKAGE
16-LEAD NARROW PLASTIC SSOP
T_{JMAX} = 150°C, θ_{JA} = 135°C/W

Note 1: Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.

Note 2: Inputs are protected by back-to-back diodes. If the differential input voltage exceeds 0.7V, the input current must be limited to less than 40mA.

Note 3: A heat sink may be required to keep the junction temperature below the absolute maximum rating when the output is shorted indefinitely.

Note 4: The LT6230C/LT6230I the LT6231C/LT6231I, and LT6232C/LT6232I are guaranteed functional over the temperature range of –40°C and 85°C.

Note 5: The LT6230C/LT6231C/LT6232C are guaranteed to meet specified performance from 0°C to 70°C. The LT6230C/LT6231C/LT6232C are designed, characterized and expected to meet specified performance from –40°C to 85°C, but are not tested or QA sampled at these temperatures. The LT6230I/LT6231I/LT6232I are guaranteed to meet specified performance from –40°C to 85°C.

ELECTRICAL CHARACTERISTICS

Note 6: Matching parameters are the difference between the two amplifiers A and D and between B and C of the LT6232; between the two amplifiers of the LT6231. CMRR and PSRR match are defined as follows: CMRR and PSRR are measured in µV/V on the matched amplifiers. The difference is calculated between the matching sides in µV/V. The result is converted to dB.

Note 7: Minimum supply voltage is guaranteed by power supply rejection ratio test.

Note 8: Output voltage swings are measured between the output and power supply rails.

Note 9: Full-power bandwidth is calculated from the slew rate:

$FPBW = SR/2\pi V_P$

Note 10: This parameter is not 100% tested.

APPLICATIONS INFORMATION

Amplifier Characteristics

Figure 1 is a simplified schematic of the LT6230/LT6231/LT6232, which has a pair of low noise input transistors Q1 and Q2. A simple current mirror, Q3/Q4, converts the differential signal to a single-ended output, and these transistors are degenerated to reduce their contribution to the overall noise.

Capacitor C1 reduces the unity-cross frequency and improves the frequency stability without degrading the gain bandwidth of the amplifier. Capacitor C_M sets the overall amplifier gain bandwidth. The differential drive generator supplies current to transistors Q5 and Q6 that swing the output from rail-to-rail.

Input Protection

There are back-to-back diodes, D1 and D2 across the + and – inputs of these amplifiers to limit the differential input voltage to ±0.7V. The inputs of the LT6230/LT6231/LT6232 do not have internal resistors in series with the input transistors. This technique is often used to protect the input devices from overvoltage that causes excessive current to flow. The addition of these resistors would significantly degrade the low noise voltage of these amplifiers. For instance, a 100Ω resistor in series with each input would generate $1.8nV/\sqrt{Hz}$ of noise, and the total amplifier noise voltage would rise from $1.1nV/\sqrt{Hz}$ to $2.1nV/\sqrt{Hz}$. Once the input differential voltage exceeds ±0.7V, steady-state current conducted through the protection diodes should be limited to ±40mA. This implies 25Ω of protection resistance is necessary per volt of overdrive beyond ±0.7V. These input diodes are rugged enough to handle transient currents due to amplifier slew rate overdrive and clipping without protection resistors.

The photo of Figure 2 shows the output response to an input overdrive with the amplifier connected as a voltage follower. With the input signal low, current source I_1 saturates and the differential drive generator drives Q6 into saturation so the output voltage swings all the way to V^-. The input can swing positive until transistor Q2 saturates into current mirror Q3/Q4. When saturation occurs, the output tries to phase invert, but diode D2 conducts current from the signal source to the output through the feedback connection. The output is clamped a diode drop below the input. In this photo, the input signal generator is limiting at about 20mA.

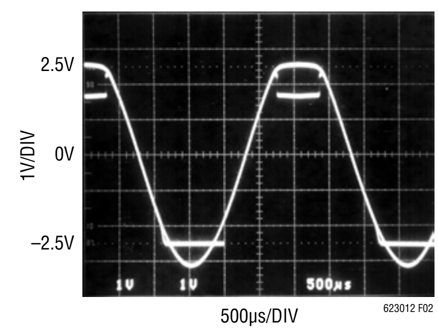

Figure 2. V_S = ±2.5V, A_V = 1 with Large Overdrive

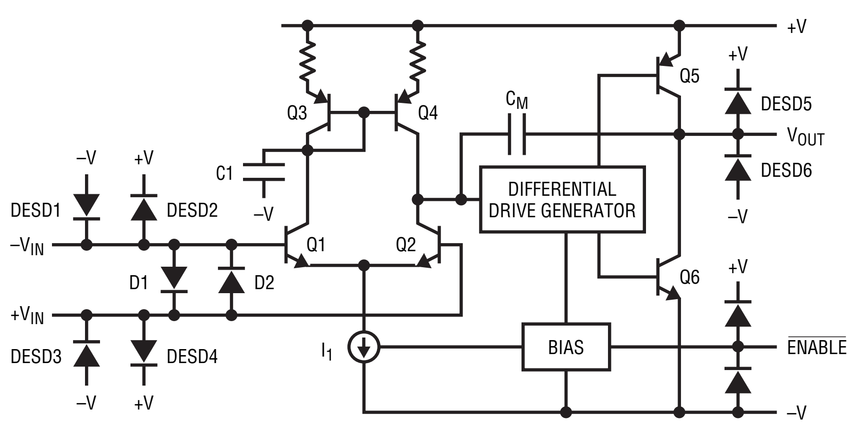

Figure 1. Simplified Schematic

APPLICATIONS INFORMATION

With the amplifier connected in a gain of $A_V \geq 2$, the output can invert with very heavy overdrive. To avoid this inversion, limit the input overdrive to 0.5V beyond the power supply rails.

ESD

The LT6230/LT6231/LT6232 have reverse-biased ESD protection diodes on all inputs and outputs as shown in Figure 1. If these pins are forced beyond either supply, unlimited current will flow through these diodes. If the current is transient and limited to one hundred milliamps or less, no damage to the device will occur.

Noise

The noise voltage of the LT6230/LT6231/LT6232 is equivalent to that of a 75Ω resistor, and for the lowest possible noise it is desirable to keep the source and feedback resistance at or below this value, i.e., $R_S + R_G||R_{FB} \leq 75\Omega$. With $R_S + R_G||R_{FB} = 75\Omega$ the total noise of the amplifier is:

$$e_N=\sqrt{(1.1nV)^2+(1.1nV)^2} = 1.55nV/\sqrt{Hz}$$

Below this resistance value, the amplifier dominates the noise, but in the region between 75Ω and about 3k, the noise is dominated by the resistor thermal noise. As the total resistance is further increased beyond 3k, the amplifier noise current multiplied by the total resistance eventually dominates the noise.

The product of $e_N \bullet \sqrt{I_{SUPPLY}}$ is an interesting way to gauge low noise amplifiers. Most low noise amplifiers with low eN have high I_{SUPPLY} current. In applications that require low noise voltage with the lowest possible supply current, this product can prove to be enlightening. The LT6230/LT6231/LT6232 have an $e_N \bullet \sqrt{I_{SUPPLY}}$ product of only 1.9 per amplifier, yet it is common to see amplifiers with similar noise specifications to have $e_N \bullet \sqrt{I_{SUPPLY}}$ as high as 13.5.

For a complete discussion of amplifier noise, see the LT1028 data sheet.

ENABLE Pin

The LT6230 includes an $\overline{ENABLE}$ pin that shuts down the amplifier to 10μA maximum supply current. The $\overline{ENABLE}$ pin must be driven low to operate the amplifier with normal supply current. The $\overline{ENABLE}$ pin must be driven high to within 0.35V of V^+ to shut down the supply current. This can be accomplished with simple gate logic; however care must be taken if the logic and the LT6230 operate from different supplies. If this is the case, then open-drain logic can be used with a pull-up resistor to ensure that the amplifier remains off. See the Typical Performance Characteristics.

The output leakage current when disabled is very low; however, current can flow into the input protection diodes D1 and D2 if the output voltage exceeds the input voltage by a diode drop.

2. DRAWING NOT TO SCALE
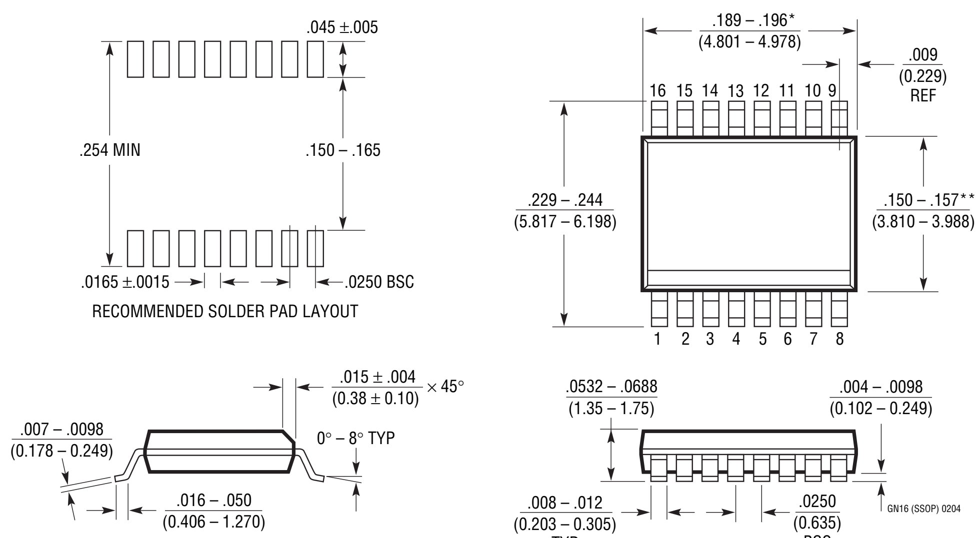
3. THESE DIMENSIONS DO NOT INCLUDE MOLD FLASH OR PROTRUSIONS.
MOLD FLASH OR PROTRUSIONS SHALL NOT EXCEED .006" (0.15mm)

SO8 0303

GN Package
16-Lead Plastic SSOP (Narrow .150 Inch)
(Reference LTC DWG # 05-08-1641)



NOTE:
1. CONTROLLING DIMENSION: INCHES
2. DIMENSIONS ARE IN $\frac{\text{INCHES}}{\text{(MILLIMETERS)}}$
3. DRAWING NOT TO SCALE
*DIMENSION DOES NOT INCLUDE MOLD FLASH. MOLD FLASH SHALL NOT EXCEED 0.006" (0.152mm) PER SIDE
**DIMENSION DOES NOT INCLUDE INTERLEAD FLASH. INTERLEAD FLASH SHALL NOT EXCEED 0.010" (0.254mm) PER SIDE

REVISION HISTORY (Revision history begins at Rev C)

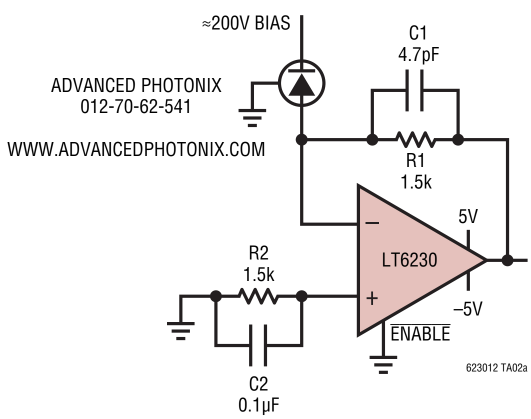
REV	DATE	DESCRIPTION	PAGE NUMBER
C	1/11	Updated ENABLE Pin section in Applications Information	18

TYPICAL APPLICATIONS

The LT6230 is applied as a transimpedance amplifier with an I-to-V conversion gain of 1.5kΩ set by R1. The LT6230 is ideally suited to this application because of its low input offset voltage and current, and its low noise. This is because the 1.5k resistor has an inherent thermal noise of 5nV/√Hz or 3.4pA/√Hz at room temperature, while the LT6230 contributes only 1.1nV and 2.4pA /√Hz. So, with respect to both voltage and current noises, the LT6230 is actually quieter than the gain resistor.

The circuit uses an avalanche photodiode with the cathode biased to approximately 200V. When light is incident on the photodiode, it induces a current I_{PD} which flows into the amplifier circuit. The amplifier output falls negative to maintain balance at its inputs. The transfer function is therefore $V_{OUT} = –I_{PD} \bullet 1.5k$. C1 ensures stability and good settling characteristics. Output offset was measured at 280µV, so low in part because R2 serves to cancel the DC effects of bias current. Output noise was measured at 1.1mV$_{P-P}$ on a 100MHz measurement bandwidth, with C2 shunting R2's thermal noise. As shown in the scope photo, the rise time is 17ns, indicating a signal bandwidth of 20MHz.

Low Power Avalanche Photodiode Transimpedance Amplifier I_S = 3.3mA



OUTPUT OFFSET = 500µV TYPICAL
BANDWIDTH = 20MHz
OUTPUT NOISE = 1.1mV$_{P-P}$ (100MHz MEASUREMENT BW)
