

Features

- Three High Linearity, Low Loss, UMTS Switch Ports
- UMTS Port to Port Isolation >20dB
- Improved Power Flatness Into VSWR Through Integrated 2.5A Current Limiter
- Low Harmonics Into VSWR
- Excellent Switching Spectrum over Extreme Conditions
- GSM850 Max PAE 41%
- EGSM900 Max PAE 38%
- DCS1800 Max PAE 38%
- PCS1900 Max PAE 40%
- All RF Ports Have Internal DC Blocking
- Drive Level 0dBm to 6dBm
- Proven *PowerStar*® Architecture

Applications

- Battery Powered 3G Handsets
- GSM850/EGSM900/DCS/PCS Products
- Multislot Class 12 Products (4TX, 4RX Timeslots)

Functional Block Diagram

Product Description

The RF3229 is a high-power, high-efficiency transmit module with integrated power control, an integrated pHEMT front end switch, and harmonic filtering functionality. This device is self-contained with 50Ω input and output terminals and no external matching circuits required. The device is designed for use as the last portion of the transmit chain in GMSK architectures in GSM850, EGSM900, DCS, and PCS handheld digital cellular equipment where UMTS pass-through ports are needed. The RF3229 high performance transmit module offers mobile handset designers a compact, easy-to-use, front-end solution for multi-mode, multi-band systems.

Ordering Information

RF3229	Quad-Band GMSK TXM, 2 RX and 3 UMTS Switch Ports
RF3229 SB	5-Piece Module Sample Pack
RF3229PCBA-410	Fully Assembled Evaluation Board

Optimum Technology Matching® Applied

Absolute Maximum Ratings

Parameter	Rating	Unit
Supply Voltage in Standby Mode	-0.5 to +6.0	V
Supply Voltage in Idle Mode	-0.5 to +6.0	V
Supply Voltage in Operating Mode (Operation time less than 100ms; $V_{RAMP} \leq 1.6V$)	-0.5 to +6.0	V
DC Continuous current during burst	2.8	A
VCTL 1 - 4	-0.5 to +3.0	V
Power Control Voltage (V_{RAMP})	-0.5 to +1.8	V
Input RF Power	+12	dBm
Duty Cycle with power reduction per 3GPP Power Profile 2	50	%
Output Load VSWR (See Ruggedness Specification)	20:1	
Operating Temperature	-30 to +85	°C
Storage Temperature	-55 to +150	°C

Caution! ESD sensitive device.

Exceeding any one or a combination of the Absolute Maximum Rating conditions may cause permanent damage to the device. Extended application of Absolute Maximum Rating conditions to the device may reduce device reliability. Specified typical performance or functional operation of the device under Absolute Maximum Rating conditions is not implied.

RoHS status based on EU Directive 2002/95/EC (at time of this document revision).

Pin	Function	Description
1	HB_RFIN	RF input to the high band power amplifier. DC blocked inside the module.
2	GND	Ground.
3	LB_RFIN	RF input to the low band power amplifier. DC blocked inside the module.
4	VRAMP	The voltage on this pin controls the output power by varying the internally regulated collector voltage on the amplifiers. This is a high bandwidth input so filter considerations for performance must be addressed externally.
5	VBATT	Main DC power supply for all circuitry in the module. Traces to this pin will have high current pulses during transmit operation. Proper decoupling and routing to handle this condition should be observed.
6	VCTL4	Digital Control Signal. Binary logic on VCTL1-4 sets module operating state.
7	VCTL3	Digital Control Signal. Binary logic on VCTL1-4 sets module operating state.
8	VCTL2	Digital Control Signal. Binary logic on VCTL1-4 sets module operating state.
9	VCTL1	Digital Control Signal. Binary logic on VCTL1-4 sets module operating state.
10	NC	No internal connection defined. Pin can be grounded on PCB.
11	GND	Ground.
12	GND	Ground.
13	RX4	Receive port 4. GSM receive port. DC blocked inside the module.
14	RX3	Receive port 3. GSM receive port. DC blocked inside the module.
15	NC	No internal connection defined. Pin can be grounded on PCB.
16	W1	UMTS Transmit and Receive port 1. DC blocked inside the module.
17	ANT	Antenna Port. 50Ω matched input/output port for RF signals going to or from the antenna.
18	NC	No internal connection defined. Pin can be grounded on PCB.
19	W2	UMTS Transmit and Receive port 2. DC blocked inside the module.
20	W3	UMTS Transmit and Receive port 3. DC blocked inside the module.
21	GND	Ground.
22	GND	Ground.
23	GND	Ground.
24	GND	Ground.

Theory of Operation

Overview

The RF3229 is designed for use as the final portion of the transmit section in mobile phones covering the GSM850, EGSM900, DCS1800, and PCS1900MHz frequency bands in architectures where UMTS pass through ports are required. The RF3229 is a high power, saturated transmit module containing RFMD's patented *PowerStar*[®] Architecture. The module includes a multi function CMOS controller, GaAs HBT power amplifier, and pHEMT front end antenna switch. The integrated power control loop allows a single analog voltage to control output power for GSM PCLs and ramping. This analog voltage can be driven directly from the transceiver DAC to provide very predictable power control, enabling handset manufacturers to achieve simple and efficient phone calibration in production.

Additional Features

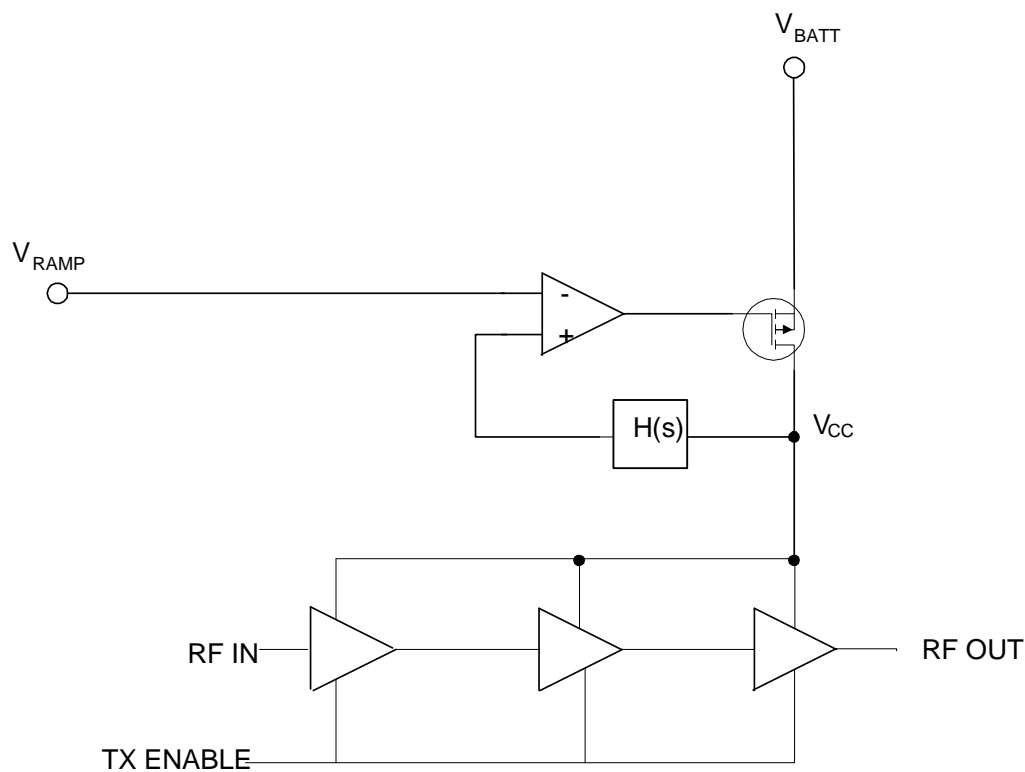

Current Limiter

During normal use, a mobile phone antenna will be subjected to a variety of conditions that can affect its designed resonant frequency. This shift in frequency appears as a varying impedance to a power amplifier connected to the antenna. As the impedance presented to the power amplifier varies, so does the output power and current consumption. If left uncontrolled, power amplifier current can reach levels that can starve other circuitry, connected to the same supply, of the required voltage to operate. This can result in a reset or shutdown of the mobile phone. The RF3229 contains an active circuit that monitors the current and adjusts the internal power control loop to prevent peak current from going above 2.6A. While this current limiter can limit transmitted power under situations where the antenna is operating at very low efficiency, it is typically more acceptable for users to have a dropped call than a phone reset.

GMSK Operation

GMSK modulation is a constant RF envelope modulation scheme which encodes information in the phase of the signal and any amplitude variation is suppressed. Since no information is included in the amplitude of the signal, GMSK transmit is not sensitive to amplitude non-linearity of the power amplifier, allowing the amplifier to operate in deep class AB or class C saturation for optimum efficiency. The power envelope can be controlled by any one of a number of power control schemes.

During GMSK transmit RF3229 operates as a traditional *PowerStar*[®] module. The basic circuit diagram is shown below. The *PowerStar*[®] control circuit receives an analog voltage (V_{RAMP}) which sets the amplifier output power. The *PowerStar*[®] I architecture is essentially a closed loop method of power control that is invisible to the user. The V_{RAMP} voltage is used as a reference to a high speed linear voltage regulator which supplies the collector voltage to all stages of the amplifier. The base bias is fixed at a point that maintains deep class AB or class C transistor saturation. Because the amplifier remains in saturation at any power level, performance sensitivity to temperature, frequency, voltage and input drive level is essentially eliminated, ensuring robust performance within the ETSI power vs time mask.

Basic *PowerStar*® Circuit Diagram

The *PowerStar*® power control relationship is described in the Equation below where V_{CC} is the voltage from the linear regulator and the other variables are constants for a given amplifier design and load. The equation shows that load impedance affects output power, but to a lesser degree than V_{CC} supply variations. Since the architecture regulates V_{CC} , the dominant cause of power variation is eliminated. Another important result is that the equation provides a very linear relationship between V_{RAMP} and P_{OUT} expressed as V_{RMS} .

$$P_{dBm} = 10 \cdot \log \left[\frac{(2 \cdot V_{CC} - V_{SAT})^2}{8 \cdot R_{LOAD} \cdot 10^{-3}} \right]$$

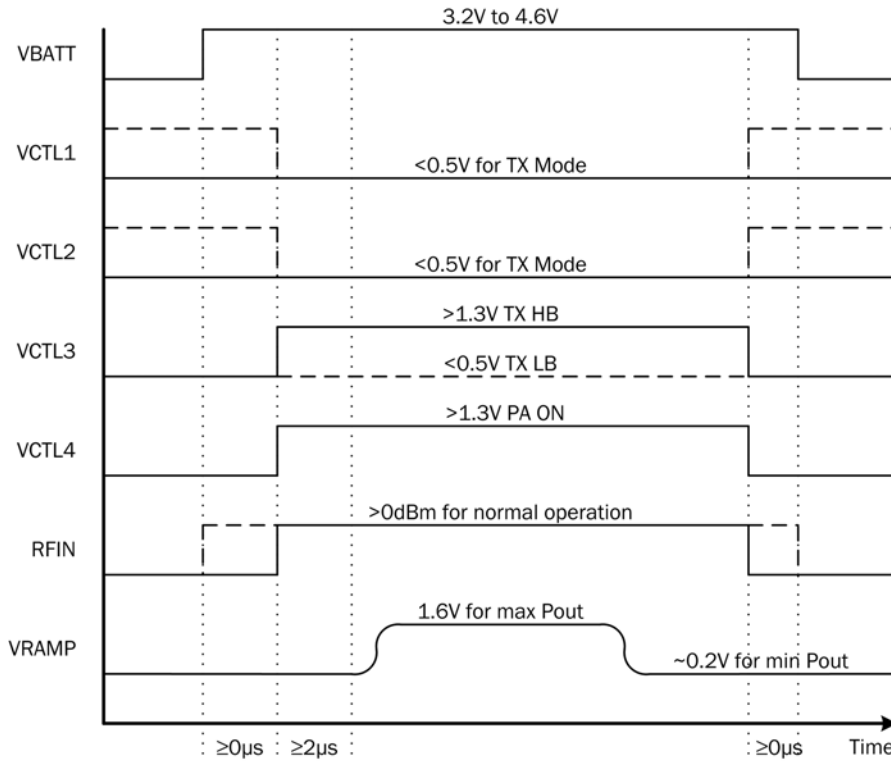

Output Power versus Voltage Relationship

The RF signal applied at RFIN of the amplifier must be a constant amplitude signal and should be high enough to saturate the amplifier. The input power (P_{IN}) range is indicated in the specifications. Power levels below this range will result in reduced maximum output power and the potential for more variation of output power over extreme conditions. Higher input power is unnecessary and will require more current in the circuitry driving the power amplifier. A higher input power may also couple to the output and will increase the minimum output power level.

Module Control Timing

In the Power-On Sequence, there are some important set-up times associated with the control signals of the TxM. Refer to the logic table for control signal functions. One of the critical relationships is the settling time between selecting TX mode and when V_{RAMP} can begin to increase. This time is often referred to as the “pedestal” and is required so that the internal power control loop and bias circuitry can settle after being turned on. The *PowerStar*® architecture usually requires approximately $1\mu s$ to $2\mu s$ for proper settling of the power control loop.

GMSK Power On/Off Sequence

Power On Sequence:

1. Apply VBATT
2. Apply VRAMP pedestal value ($\approx 0.25V$)
3. Apply RFIN
4. Apply VCTL1-4 for TX Mode
5. Ramp VRAMP for desired output power

Steps 2, 3, 4 can occur at the same time.

RFIN can be applied at any time. For good transient response it must be applied before power ramp begins.

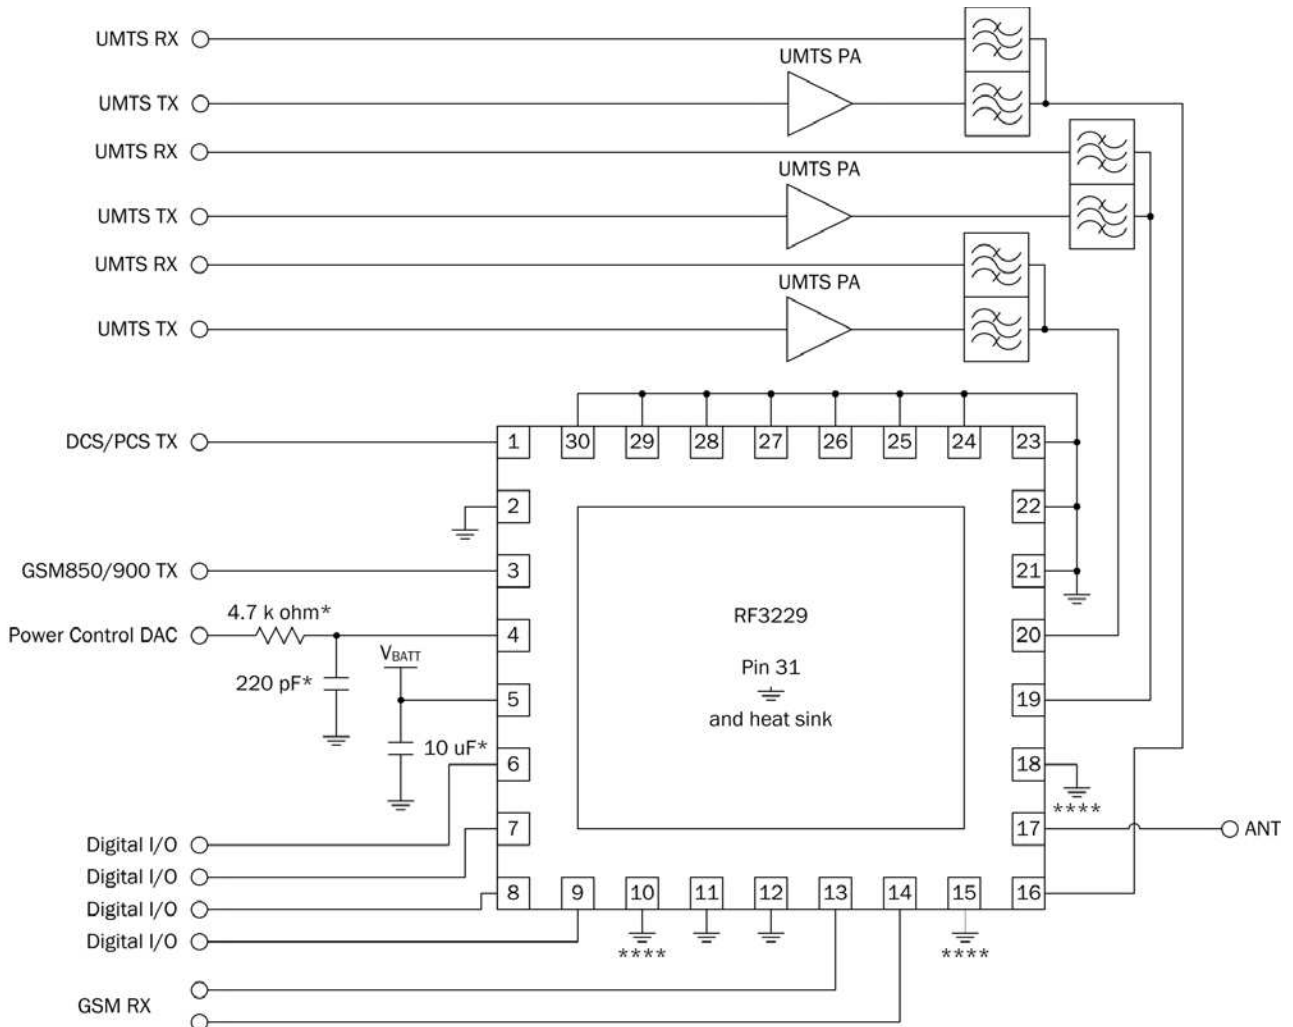

The Power Down Sequence is the reverse order of the Power On Sequence.

Power Ramping

The V_{RAMP} waveform must be created such that the output power falls into the ETSI power versus time mask. The ability to ramp the RF output power to meet ETSI switching transient and time mask requirements partially depends upon the predictability of output power versus V_{RAMP} response of the power amplifier. The *PowerStar*® control loop is very capable of meeting switching transient requirements with the proper raised cosine waveform applied to the V_{RAMP} input. Ramp times between $10\mu s$ and $14\mu s$ can be optimized to provide excellent switching transients at high power levels. Shorter ramps will have a higher rate of change which will produce higher transients. Longer ramps may have difficulty meeting the time mask. Optimization needs to include all power levels as the time mask requirements change with P_{OUT} levels.

The RF3229 does not include a power control loop detection/correction circuit such as the V_{BATT} tracking circuit found in some *PowerStar*® modules. If V_{RAMP} is set to a voltage where the FET pass-device in the linear regulator saturates, the response time of the regulated voltage (V_{CC}) slows significantly. Upon ramp-down, the saturated linear regulator does not react immediately, and the output power does not follow the desired ramp-down curve. The result is a discontinuity in the output power ramp and degraded switching transients. To prevent this from happening, V_{RAMP} must be limited as the supply voltage is reduced. By maintaining $V_{RAMP} \leq 0.345 \cdot V_{BATT} + 0.26$, the linear regulator will avoid deep saturation and serious switching transient degradation will be avoided.

Application Schematic

Notes:

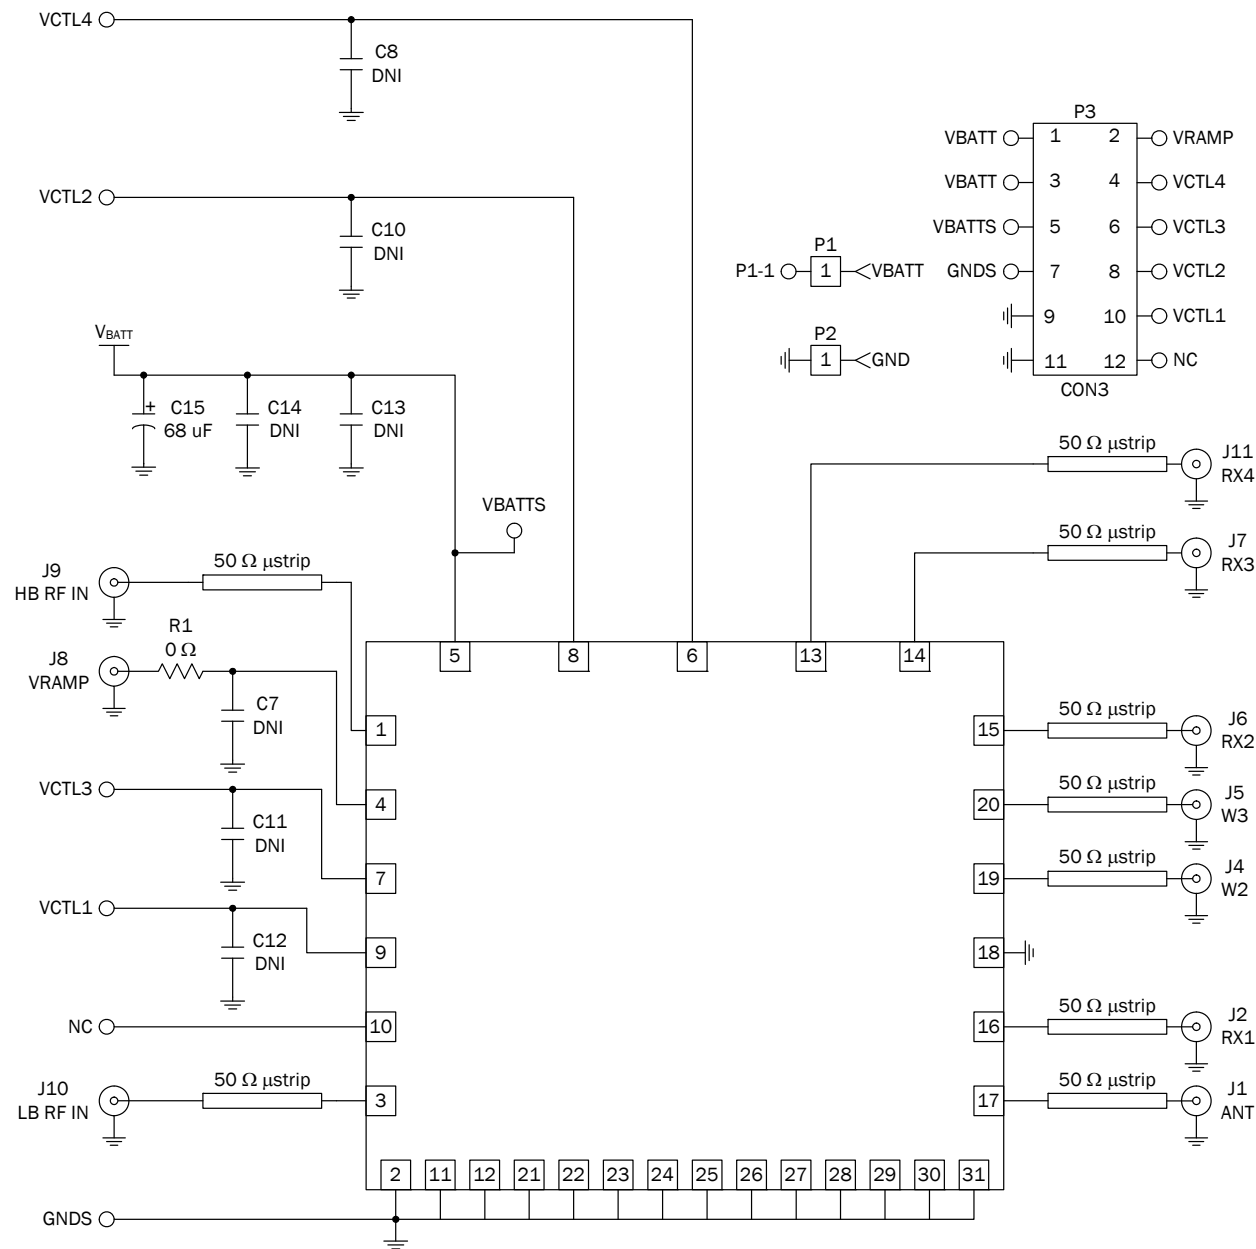

* Suggested values only. Actual requirements will vary with application.

**All RF paths should be designed as 50 ohm microstrip or stripline.

***Harmonic power from the high band amplifier near 11GHz is influenced by board layout and antenna impedance. Any matching components applied to the ANT port should be configured as a low pass filter to attenuate frequencies well above the normal GSM and UMTS transmit and receive signals.

****NC pins on this module can be connected to ground.

Evaluation Board Schematic

Evaluation Board Layout

Board Size 3.5" x 2.0"

Board Thickness 0.042", Board Material R04003 Top Layer, FR-4 Core and Bottom Layer

PCB Design Requirements

PCB Surface Finish

The PCB surface finish used for RFMD's qualification process is electroless nickel, immersion gold. Typical thickness is 2 µinch to 5 µinch gold over 180 µinch nickel.

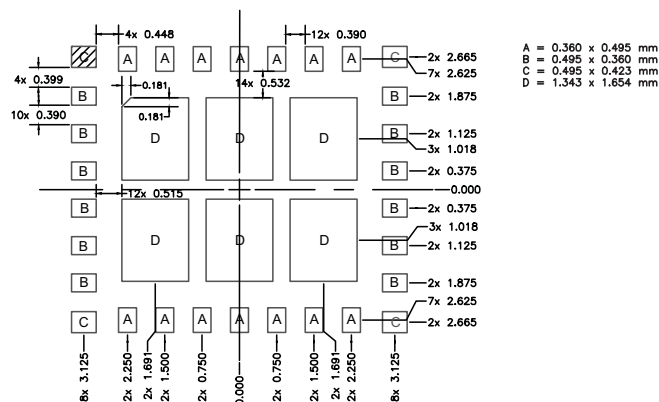

PCB Land Pattern Recommendation

PCB land patterns for RFMD components are based on IPC-7351 standards and RFMD empirical data. The pad pattern shown has been developed and tested for optimized assembly at RFMD. The PCB land pattern has been developed to accommodate lead and package tolerances. Since surface mount processes vary from company to company, careful process development is recommended.

PCB Stencil Pattern

Tape and Reel

Carrier tape basic dimensions are based on EIA 481. The pocket is designed to hold the part for shipping and loading onto SMT manufacturing equipment, while protecting the body and the solder terminals from damaging stresses. The individual pocket design can vary from vendor to vendor, but width and pitch will be consistent.

Carrier tape is wound or placed onto a shipping reel either 330mm (13 inches) in diameter or 178mm (7 inches) in diameter. The center hub design is large enough to ensure the radius formed by the carrier tape around it does not put unnecessary stress on the parts.

Prior to shipping, moisture sensitive parts (MSL level 2a-5a) are baked and placed into the pockets of the carrier tape. A cover tape is sealed over the top of the entire length of the carrier tape. The reel is sealed in a moisture barrier ESD bag with the appropriate units of desiccant and a humidity indicator card, which is placed in a cardboard shipping box. It is important to note that unused moisture sensitive parts need to be resealed in the moisture barrier bag. If the reels exceed the exposure limit and need to be rebaked, most carrier tape and shipping reels are not rated as bakeable at 125 °C. If baking is required, devices may be baked according to section 4, table 4-1, of Joint Industry Standard IPC/JEDEC J-STD-033.

The table below provides information for carrier tape and reels used for shipping the devices described in this document.

Tape and Reel

RFMD Part Number	Reel Diameter Inch (mm)	Hub Diameter Inch (mm)	Width (mm)	Pocket Pitch (mm)	Feed	Units per Reel
RF3229TR13	13 (330)	4 (102)	16	8	Single	2500
RF3229TR7	7 (178)	2.4 (61)	16	8	Single	750
