RF3266

3V W-CDMA LINEAR PA MODULE

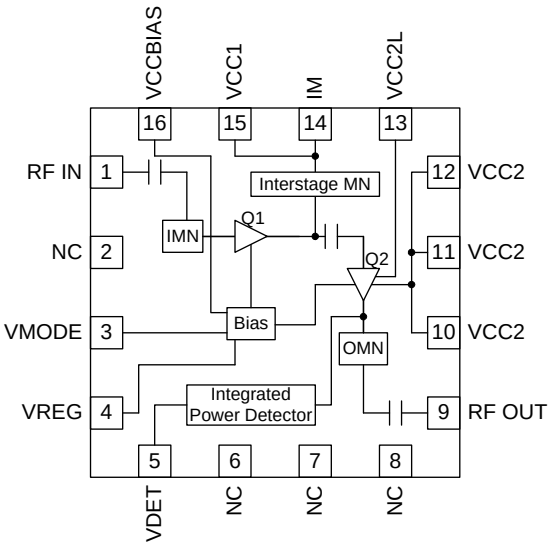
Package Style: QFN, 16-Pin, 3x3x0.9mm

Features

- +28dBm Linear Output Power, ULRMC12.2 (26.5dBm, HSDPA)
- 27.5dBm Linear Output Power for TDSCDMA
- +28dB Linear Gain at +28dBm
- Digital Controlled HPM/LPM
- HSDPA Capable
- Low Quiescent Current (LPM <20mA)
- 21% Linear Efficiency@19dBm (LPM)

Applications

- 3V W-CDMA Handsets
- Multi-Mode W-CDMA 3G Handsets
- TDSCDMA Handset (2010MHz to 2025MHz) (1880MHz to 1920MHz)
- Spread-Spectrum Systems
- PCMCIA Cards



Functional Block Diagram

Product Description

The RF3266 is a high-power, high-efficiency, linear PA module designed for use as the final RF amplifier in 3V, 50Ω W-CDMA handheld digital cellular equipment, spread-spectrum systems, and other applications in the 1920MHz to 1980MHz band. The RF3266 has a digital control pin which, when enabled, will allow the amplifier to operate up to 19dBm output power with reduced current consumption. In the Low Power Mode, the current consumption may be reduced by more than 50% that of a standard power amplifier. The RF3266 is fully HSDPA-capable and is assembled in a 16-pin, 3mmx3mm, QFN package.

Absolute Maximum Ratings

Parameter	Rating	Unit
Supply Voltages, V_{CC} (No RF)	7.0	V
Supply Voltage,VCC (with RF) P_{INMAX}=5dBm, P_{OUT}=29dBm, VSWR=5:1	4.3	V
Supply Voltage, VCCBIAS	7.0	V
Control Voltage, VMODE	3.5	V
Control Voltage, V_{REG}	3.5	V
RF - Input Power	+6	dBm
RF - Output Power	+30	dBm
Operating Case Temperature	-30 to +110	°C
Storage Temperature	-40 to +150	°C

Caution! ESD sensitive device.

Exceeding any one or a combination of the Absolute Maximum Rating conditions may cause permanent damage to the device. Extended application of Absolute Maximum Rating conditions to the device may reduce device reliability. Specified typical performance or functional operation of the device under Absolute Maximum Rating conditions is not implied.

RoHS status based on EUDirective2002/95/EC (at time of this document revision).

Parameter	Specification			Unit	Condition
	Min.	Typ.	Max.		
High Power Mode (V_{MODE} Low)					T_C=+25°C, V_{CC}=3.4V, V_{MODE}=0V, V_{REG}=2.85V, Mod.=W-CDMA ULRMC 12.2, P_{OUT}=+28dBm, unless otherwise specified.
Operating Frequency Range	1920		1980	MHz

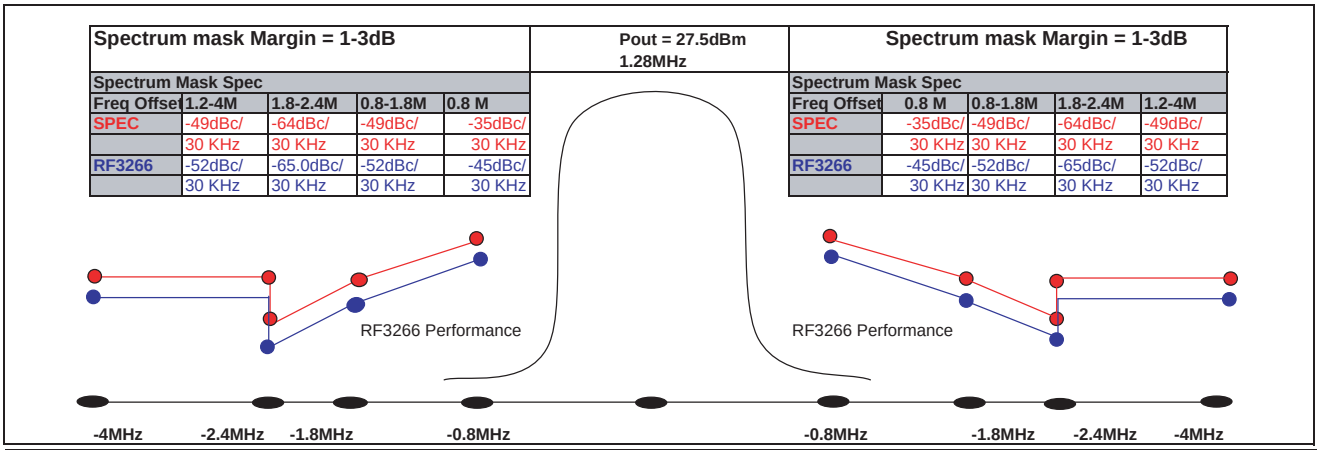
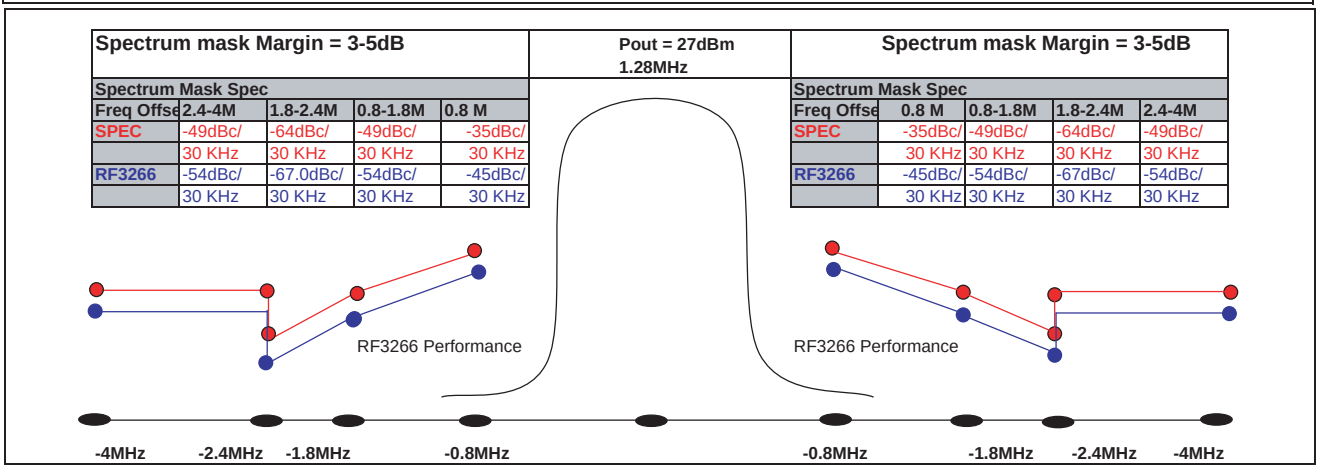
TDSCDMA - SEM Margin for 2010 MHz and 1900 MHz Band





Condition Table 1

A) Max Linear Output (P_{OUTMAX_1}) reduction at normal and high voltage (V_{CC}>3.4V).

As a reference, the following setup shall be used for HSDPA test with reduced output power.

Parameter	Conditions	Level
Output Power ($P_{OUT\_MAX\_1}$) for different ratio of β_c to β_d for all values of β_{hs}	A) $1/15 \le \beta_c/\beta_d \le 12/15$	+26.5dBm
	B) $13/15 \le \beta_c/\beta_d \le 15/8$	+25.5dBm
	C) $15/7 \le \beta_c/\beta_d \le 15/0$	+24.5dBm

Condition Table 2

A) Max Linear Output (P_{OUTMAX_1}) reduction at normal and high voltage (V_{CC}>3.4V).

As a reference, the following setup shall be used for HSDPA test with reduced output power.

Parameter	Conditions	Level
Output Power ($P_{OUT\_MAX\_1}$) for different ratio of β_c to β_d for all values of β_{hs}	A) $1/15 \le \beta_c/\beta_d \le 12/15$	+18dBm
	B) $13/15 \le \beta_c/\beta_d \le 15/8$	+17dBm
	C) $15/7 \le \beta_c/\beta_d \le 15/0$	+16dBm

Pin	Function	Description
1	RF IN	AC-coupled RF input internally matched to 50Ω.
2	NC	This pin can either ground or remain floating. It will not impact electrical performance of the device.
3	VMODE	Digital control voltage input for switching the PA from low power mode to high power mode and vice versa. A "low" on this pin operates the PA in the specified high power mode. A "high" on this pin operates the PA in the specified low power mode.
4	VREG	Regulated voltage input required for operation of PA bias circuitry. This pin also functions as the PA enable/disable control.
5	VDET	An external load resistor (RDET) is required on this pin. A lowpass filter of averaging functionality is also required to reduce voltage ripple (due to modulation) to an acceptable amount. An isolator is required on the PA output for proper operation of PDET when the PA operates into a non-50Ω load impedance.
6	NC	This pin must remain floating.
7	NC	This pin must remain floating.
8	NC	This pin must remain floating.
9	RF OUT	AC-coupled RF output internally matched to 50Ω.
10	VCC2	Power supply input for the collector voltage on Q2 RF output amplification stage. A low frequency decoupling capacitor (4.7μF) is required on this line. The voltage on this pin may be controlled by a DC converter.
11	VCC2	Same as pin 10.
12	VCC2	Same as pin 10.
13	VCC2L	Power supply input for the collector voltage on LPM Q2 RF output amplification stage. A low frequency decoupling capacitor (4.7μF) is required on this line. The voltage on this pin may be controlled by a DC-DC converter.
14	IM	Interstage matching.
15	VCC1	Power supply input for the collector voltage on Q1 RF output amplification stage. A low frequency decoupling capacitor (4.7μF) is required on this line. The voltage on this pin may be controlled by a DC-DC converter. Pin 15 is connected internally to pin 14, and should be connected together on the PCB.
16	VCCBIAS	Power supply input for the DC bias circuitry. The voltage on this pin must be 3.1V or greater for specified operation. Low frequency decoupling capacitors (4.7μF and 1nF) are recommended on this line.
Pkg Base	GND	Ground connection. The package backside should be soldered to a topside ground pad connecting to the PCB ground plane with multiple vias. The pad should have a low thermal resistance and low electrical impedance to the ground plane.

PCB Design Requirements

PCB Surface Finish

The PCB surface finish used for RFMD's qualification process is electroless nickel, immersion gold. Typical thickness is 3μinch to 8μinch gold over 180μinch nickel.

PCB Land Pattern Recommendation

PCB land patterns for RFMD components are based on IPC-7351 standards and RFMD empirical data. The pad pattern shown has been developed and tested for optimized assembly at RFMD. The PCB land pattern has been developed to accommodate lead and package tolerances. Since surface mount processes vary from company to company, careful process development is recommended.

PCB Metal Land Pattern

A = 0.64 x 0.28 (mm) Typ.
B = 0.28 x 0.64 (mm) Typ.
C = 0.78 x 0.64 (mm)
D = 0.64 x 1.28 (mm)
E = 1.50 (mm) Sq.

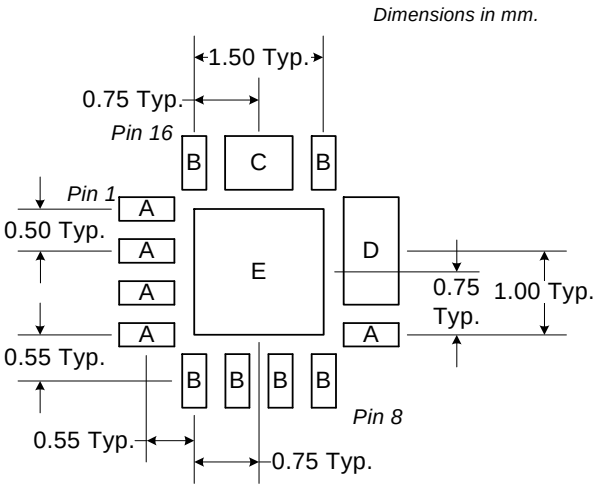

Figure 1. PCB Metal Land Pattern (Top View)

PCB Solder Mask Pattern

Liquid Photo-Imageable (LPI) solder mask is recommended. The solder mask footprint will match what is shown for the PCB metal land pattern with a 2mil to 3mil expansion to accommodate solder mask registration clearance around all pads. The center-grounding pad shall also have a solder mask clearance. Expansion of the pads to create solder mask clearance can be provided in the master data or requested from the PCB fabrication supplier.

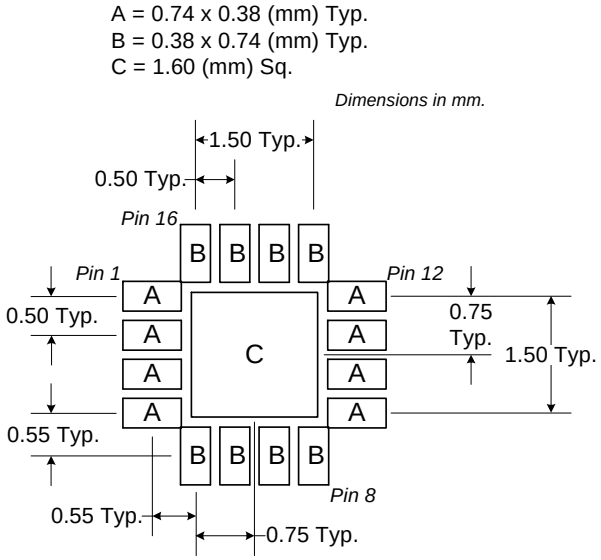

Figure 2. PCB Solder Mask Pattern (Top View)

Thermal Pad and Via Design

The PCB land pattern has been designed with a thermal pad that matches the die paddle size on the bottom of the device.

Thermal vias are required in the PCB layout to effectively conduct heat away from the package. The via pattern has been designed to address thermal, power dissipation and electrical requirements of the device as well as accommodating routing strategies.

The via pattern used for the RFMD qualification is based on thru-hole vias with 0.203mm to 0.330mm finished hole size on a 0.5mm to 1.2mm grid pattern with 0.025mm plating on via walls. If micro vias are used in a design, it is suggested that the quantity of vias be increased by a 4:1 ratio to achieve similar results.

Tape and Reel Information

Carrier tape basic dimensions are based on EIA481. The pocket is designed to hold the part for shipping and loading onto SMT manufacturing equipment, while protecting the body and the solder terminals from damaging stresses. The individual pocket design can vary from vendor to vendor, but width and pitch will be consistent.

Carrier tape is wound or placed onto a shipping reel either 330 mm (13 inches) in diameter or 178 mm (7 inches) in diameter. The center hub design is large enough to ensure the radius formed by the carrier tape around it does not put unnecessary stress on the parts.

Prior to shipping, moisture sensitive parts (MSL level 2a-5a) are baked and placed into the pockets of the carrier tape. A cover tape is sealed over the top of the entire length of the carrier tape. The reel is sealed in a moisture barrier, ESD bag, which is placed in a cardboard shipping box. It is important to note that unused moisture sensitive parts need to be resealed in the moisture barrier bag. If the reels exceed the exposure limit and need to be rebaked, most carrier tape and shipping reels are not rated as bakeable at 125°C. If baking is required, devices may be baked according to section 4, table 4-1, column 8 of Joint Industry Standard IPC/JEDEC J-STD-033A.

The following table provides useful information for carrier tape and reels used for shipping the devices described in this document.

RFMD Part Number	Reel Diameter Inch (mm)	Hub Diameter Inch (mm)	Width (mm)	Pocket Pitch (mm)	Feed	Units per Reel
RF3266TR7	7 (178)	2.4 (61)	12	4	Single	2500
