

K61P144M120SF3

K61 Sub-Family Data Sheet

Supports the following:

MK61FX512VMD12,
MK61FN1M0VMD12

Features

- Operating Characteristics
 - Voltage range: 1.71 to 3.6 V
 - Flash write voltage range: 1.71 to 3.6 V
 - Temperature range (ambient): -40 to 105°C
- Performance
 - Up to 120 MHz ARM Cortex-M4 core with DSP instructions delivering 1.25 Dhrystone MIPS per MHz
- Memories and memory interfaces
 - Up to 1024 KB program flash memory on non-FlexMemory devices
 - Up to 512 KB program flash memory on FlexMemory devices
 - Up to 512 KB FlexNVM on FlexMemory devices
 - 16 KB FlexRAM on FlexMemory devices
 - Up to 128 KB RAM
 - Serial programming interface (EzPort)
 - FlexBus external bus interface
 - NAND flash controller interface
- Clocks
 - 3 to 32 MHz crystal oscillator
 - 32 kHz crystal oscillator
 - Multi-purpose clock generator
- System peripherals
 - 10 low-power modes to provide power optimization based on application requirements
 - Memory protection unit with multi-master protection
 - 32-channel DMA controller, supporting up to 128 request sources
 - External watchdog monitor
 - Software watchdog
 - Low-leakage wakeup unit
- Security and integrity modules
 - Hardware CRC module to support fast cyclic redundancy checks
 - Tamper detect and secure storage
 - Hardware random-number generator
 - Hardware encryption supporting DES, 3DES, AES, MD5, SHA-1, and SHA-256 algorithms
 - 128-bit unique identification (ID) number per chip
- Human-machine interface
 - Low-power hardware touch sensor interface (TSI)
 - General-purpose input/output
- Analog modules
 - Four 16-bit SAR ADCs
 - Programmable gain amplifier (PGA) (up to x64) integrated into each ADC
 - Two 12-bit DACs
 - Four analog comparators (CMP) containing a 6-bit DAC and programmable reference input
 - Voltage reference
- Timers
 - Programmable delay block
 - Two 8-channel motor control/general purpose/PWM timers
 - Two 2-channel quadrature decoder/general purpose timers
 - IEEE 1588 timers
 - Periodic interrupt timers
 - 16-bit low-power timer
 - Carrier modulator transmitter
 - Real-time clock

This document contains information on a new product. Specifications and information herein are subject to change without notice.

- Communication interfaces
 - Ethernet controller with MII and RMII interface to external PHY and hardware IEEE 1588 capability
 - USB high-/full-/low-speed On-the-Go controller with ULPI interface
 - USB full-/low-speed On-the-Go controller with on-chip transceiver
 - Two Controller Area Network (CAN) modules
 - Three SPI modules
 - Two I2C modules
 - Six UART modules
 - Secure Digital host controller (SDHC)
 - Two I2S modules

1 Ordering parts

1.1 Determining valid orderable parts

Valid orderable part numbers are provided on the web. To determine the orderable part numbers for this device, go to <http://www.freescale.com> and perform a part number search for the following device numbers: PK61 and MK61.

2 Part identification

2.1 Description

Part numbers for the chip have fields that identify the specific part. You can use the values of these fields to determine the specific part you have received.

2.2 Format

Part numbers for this device have the following format:

Q K## A M FFF T PP CC N

2.3 Fields

This table lists the possible values for each field in the part number (not all combinations are valid):

Field	Description	Values
Q	Qualification status	- M = Fully qualified, general market flow - P = Prequalification
K##	Kinetis family	K61
A	Key attribute	- D = Cortex-M4 w/ DSP - F = Cortex-M4 w/ DSP and FPU
M	Flash memory type	- N = Program flash only - X = Program flash and FlexMemory

Table continues on the next page...

Terminology and guidelines

Field	Description	Values
FFF	Program flash memory size	• 32 = 32 KB • 64 = 64 KB • 128 = 128 KB • 256 = 256 KB • 512 = 512 KB • 1M0 = 1 MB
T	Temperature range (°C)	• V = -40 to 105 • C = -40 to 85
PP	Package identifier	• MD = 144 MAPBGA (13 mm x 13 mm)
CC	Maximum CPU frequency (MHz)	• 12 = 120 MHz
N	Packaging type	• R = Tape and reel • (Blank) = Trays

2.4 Example

This is an example part number:

MK61FN1M0VMD12

3 Terminology and guidelines

3.1 Definition: Operating requirement

An *operating requirement* is a specified value or range of values for a technical characteristic that you must guarantee during operation to avoid incorrect operation and possibly decreasing the useful life of the chip.

3.1.1 Example

This is an example of an operating requirement, which you must meet for the accompanying operating behaviors to be guaranteed:

Symbol	Description	Min.	Max.	Unit
V _{DD}	1.0 V core supply voltage	0.9	1.1	V

3.2 Definition: Operating behavior

An *operating behavior* is a specified value or range of values for a technical characteristic that are guaranteed during operation if you meet the operating requirements and any other specified conditions.

3.2.1 Example

This is an example of an operating behavior, which is guaranteed if you meet the accompanying operating requirements:

Symbol	Description	Min.	Max.	Unit
I _{WP}	Digital I/O weak pullup/pulldown current	10	130	μA

3.3 Definition: Attribute

An *attribute* is a specified value or range of values for a technical characteristic that are guaranteed, regardless of whether you meet the operating requirements.

3.3.1 Example

This is an example of an attribute:

Symbol	Description	Min.	Max.	Unit
CIN_D	Input capacitance: digital pins	—	7	pF

3.4 Definition: Rating

A *rating* is a minimum or maximum value of a technical characteristic that, if exceeded, may cause permanent chip failure:

- *Operating ratings* apply during operation of the chip.
- *Handling ratings* apply when the chip is not powered.

3.4.1 Example

This is an example of an operating rating:

Symbol	Description	Min.	Max.	Unit
V _{DD}	1.0 V core supply voltage	-0.3	1.2	V

3.5 Result of exceeding a rating

3.6 Relationship between ratings and operating requirements

Operating or handling rating (min.)		Operating requirement (min.)		Operating requirement (max.)		Operating or handling rating (max.)	
Fatal range - Probable permanent failure	Limited operating range - No permanent failure - Possible decreased life - Possible incorrect operation	Normal operating range - No permanent failure - Correct operation	Limited operating range - No permanent failure - Possible decreased life - Possible incorrect operation	Fatal range - Probable permanent failure			
	Handling range - No permanent failure						

3.7 Guidelines for ratings and operating requirements

Follow these guidelines for ratings and operating requirements:

- Never exceed any of the chip's ratings.

- During normal operation, don't exceed any of the chip's operating requirements.
- If you must exceed an operating requirement at times other than during normal operation (for example, during power sequencing), limit the duration as much as possible.

3.8 Definition: Typical value

A *typical value* is a specified value for a technical characteristic that:

- Lies within the range of values specified by the operating behavior
- Given the typical manufacturing process, is representative of that characteristic during operation when you meet the typical-value conditions or other specified conditions

Typical values are provided as design guidelines and are neither tested nor guaranteed.

3.8.1 Example 1

This is an example of an operating behavior that includes a typical value:

Symbol	Description	Min.	Typ.	Max.	Unit
I _{WP}	Digital I/O weak pullup/pulldown current	10	70	130	μA

3.8.2 Example 2

This is an example of a chart that shows typical values for various voltage and temperature conditions:

Ratings

3.9 Typical value conditions

Typical values assume you meet the following conditions (or other conditions as specified):

Symbol	Description	Value	Unit
T _A	Ambient temperature	25	°C
V _{DD}	3.3 V supply voltage	3.3	V

4 Ratings

4.1 Thermal handling ratings

Symbol	Description	Min.	Max.	Unit	Notes
T _{STG}	Storage temperature	-55	150	°C	1
T _{SDR}	Solder temperature, lead-free	—	260	°C	2

1. Determined according to JEDEC Standard JESD22-A103, *High Temperature Storage Life*.
2. Determined according to IPC/JEDEC Standard J-STD-020, *Moisture/Reflow Sensitivity Classification for Nonhermetic Solid State Surface Mount Devices*.

4.2 Moisture handling ratings

Symbol	Description	Min.	Max.	Unit	Notes
MSL	Moisture sensitivity level	—	3	—	1

1. Determined according to IPC/JEDEC Standard J-STD-020, *Moisture/Reflow Sensitivity Classification for Nonhermetic Solid State Surface Mount Devices*.

4.3 ESD handling ratings

Symbol	Description	Min.	Max.	Unit	Notes
V _{HBM}	Electrostatic discharge voltage, human body model	-2000	+2000	V	1
V _{CDM}	Electrostatic discharge voltage, charged-device model	-500	+500	V	2
I _{LAT}	Latch-up current at ambient temperature of 105°C	-100	+100	mA	

1. Determined according to JEDEC Standard JESD22-A114, *Electrostatic Discharge (ESD) Sensitivity Testing Human Body Model (HBM)*.
2. Determined according to JEDEC Standard JESD22-C101, *Field-Induced Charged-Device Model Test Method for Electrostatic-Discharge-Withstand Thresholds of Microelectronic Components*.

4.4 Voltage and current operating ratings

Symbol	Description	Min.	Max.	Unit
V _{DD}	Digital supply voltage ¹	-0.3	3.8	V
I _{DD}	Digital supply current	—	300	mA
V _{DIO}	Digital input voltage (except $\overline{\text{RESET}}$, EXTAL0/XTAL0, and EXTAL1/XTAL1) ²	-0.3	5.5	V
V _{DTamper}	Tamper input voltage	-0.3	V _{BAT} + 0.3	V
V _{AIO}	Analog ³ , $\overline{\text{RESET}}$, EXTAL0/XTAL0, and EXTAL1/XTAL1 input voltage	-0.3	V _{DD} + 0.3	V
I _D	Instantaneous maximum current single pin limit (applies to all digital pins except Tamper pins)	-25	25	mA
I _{D_Tamper}	Instantaneous maximum current single pin limit (applies to Tamper pins)	TBD	TBD	mA
V _{DDA}	Analog supply voltage	V _{DD} - 0.3	V _{DD} + 0.3	V
V _{USB_DP}	USB_DP input voltage	-0.3	3.63	V
V _{USB_DM}	USB_DM input voltage	-0.3	3.63	V
V _{REGIN}	USB regulator input	-0.3	6.0	V

Table continues on the next page...

General

Symbol	Description	Min.	Max.	Unit
V _{BAT}	RTC battery supply voltage	-0.3	3.8	V

1. It applies for all port pins except Tamper pins.
2. It covers digital pins except Tamper pins.
3. Analog pins are defined as pins that do not have an associated general purpose I/O port function.

5 General

5.1 AC electrical characteristics

Unless otherwise specified, propagation delays are measured from the 50% to the 50% point, and rise and fall times are measured at the 20% and 80% points, as shown in the following figure.

Figure 1. Input signal measurement reference

All digital I/O switching characteristics assume:

1. output pins
 - have $C_L=30\text{pF}$ loads,
 - are configured for fast slew rate (PORTx_PCRn[SRE]=0), and
 - are configured for high drive strength (PORTx_PCRn[DSE]=1)
2. input pins
 - have their passive filter disabled (PORTx_PCRn[PFE]=0)

Table 1. Voltage and current operating requirements (continued)

Symbol	Description	Min.	Max.	Unit	Notes
I_{ICont}	Contiguous pin DC injection current —regional limit, includes sum of negative injection currents or sum of positive injection currents of 16 contiguous pins - Negative current injection - Positive current injection	-25 —	— +25	mA	
V_{RAM}	V_{DD} voltage required to retain RAM	1.2	—	V	
V_{RFVBAT}	V_{BAT} voltage required to retain the VBAT register file	V_{POR_VBAT}	—	V	

- All 5 V tolerant digital I/O pins are internally clamped to V_{SS} through a ESD protection diode. There is no diode connection to V_{DD} . If V_{IN} greater than V_{DIO_MIN} ($=V_{SS}-0.3V$) is observed, then there is no need to provide current limiting resistors at the pads. If this limit cannot be observed then a current limiting resistor is required. The negative DC injection current limiting resistor is calculated as $R=(V_{DIO_MIN}-V_{IN})/|I_{IC}|$.
- Analog pins are defined as pins that do not have an associated general purpose I/O port function.
- All analog pins are internally clamped to V_{SS} and V_{DD} through ESD protection diodes. If V_{IN} is greater than V_{AIO_MIN} ($=V_{SS}-0.3V$) and V_{IN} is less than V_{AIO_MAX} ($=V_{DD}+0.3V$) is observed, then there is no need to provide current limiting resistors at the pads. If these limits cannot be observed then a current limiting resistor is required. The negative DC injection current limiting resistor is calculated as $R=(V_{AIO_MIN}-V_{IN})/|I_{IC}|$. The positive injection current limiting resistor is calculated as $R=(V_{IN}-V_{AIO_MAX})/|I_{IC}|$. Select the larger of these two calculated resistances.

9. Includes 32kHz oscillator current and RTC operation.

5.2.5.1 Diagram: Typical I_{DD_RUN} operating behavior

The following data was measured under these conditions:

- MCG in FBE mode for 50 MHz and lower frequencies. MCG in FEE mode at greater than 50 MHz frequencies. MCG in PEE mode is greater than 100 MHz frequencies.
- USB regulator disabled
- No GPIOs toggled
- Code execution from flash with cache enabled
- For the ALLOFF curve, all peripheral clocks are disabled except FTL

V _{RE4}	Radiated emissions voltage, band 4	500–1000	TBD	dBμV	
V _{RE_IEC}	IEC level	0.15–1000	K	—	2, 3

1. Determined according to IEC Standard 61967-1, *Integrated Circuits - Measurement of Electromagnetic Emissions, 150 kHz to 1 GHz Part 1: General Conditions and Definitions* and IEC Standard 61967-2, *Integrated Circuits - Measurement of Electromagnetic Emissions, 150 kHz to 1 GHz Part 2: Measurement of Radiated Emissions—TEM Cell and Wideband TEM Cell Method*. Measurements were made while the microcontroller was running basic application code. The reported emission level is the value of the maximum measured emission, rounded up to the next whole number, from among the measured orientations in each frequency range.
2. V_{DD} = 3.3 V, T_A = 25 °C, f_{OSC} = 12 MHz (crystal), f_{SYS} = 96 MHz, f_{BUS} = 48 MHz

3. Specified according to Annex D of IEC Standard 61967-2, *Measurement of Radiated Emissions—TEM Cell and Wideband TEM Cell Method*

1. This parameter is measured with the internal reference (slow clock) being used as a reference to the FLL (FEI clock mode).
2. These typical values listed are with the slow internal reference clock (FEI) using factory trim and DMX32=0.
3. The resulting system clock frequencies should not exceed their maximum specified values. The DCO frequency deviation (Δf_{dco_t}) over voltage and temperature should be considered.
4. These typical values listed are with the slow internal reference clock (FEI) using factory trim and DMX32=1.
5. The resulting clock frequency must not exceed the maximum specified clock frequency of the device.
6. This specification applies to any time the FLL reference source or reference divider is changed, trim value is changed, DMX32 bit is changed, DRS bits are changed, or changing from FLL disabled (BLPE, BLPI) to FLL enabled (FEI, FEE, FBE, FBI). If a crystal/resonator is being used as the reference, this specification assumes it is already running.
7. Excludes any oscillator currents that are also consuming power while PLL is in operation.
8. This specification applies to any time the PLL VCO divider or reference divider is changed, or changing from PLL disabled (BLPE, BLPI) to PLL enabled (PBE, PEE). If a crystal/resonator is being used as the reference, this specification assumes it is already running.
9. Accumulated jitter will depend on VCO frequency and VDIV.

- Frequencies less than 8 MHz are not in the PLL range.
- Other frequency limits may apply when external clock is being used as a reference for the FLL or PLL.
- When transitioning from FBE to FEI mode, restrict the frequency of the input clock so that, when it is divided by FRDIV, it remains within the limits of the DCO input clock frequency.
- Proper PC board layout procedures must be followed to achieve specifications.
- Crystal startup time is defined as the time between the oscillator being enabled and the OSCINIT bit in the MCG_S register being set.

1. Typical data retention values are based on measured response accelerated at high temperature and derated to a constant 25°C profile. Engineering Bulletin EB618 does not apply to this technology.
2. Data retention is based on $T_{\text{javg}} = 55^{\circ}\text{C}$ (temperature profile over the lifetime of the application).
3. Cycling endurance represents number of program/erase cycles at $-40^{\circ}\text{C} \leq T_j \leq 125^{\circ}\text{C}$.
4. Write endurance represents the number of writes to each FlexRAM location at $-40^{\circ}\text{C} \leq T_j \leq 125^{\circ}\text{C}$ influenced by the cycling endurance of the FlexNVM (same value as data flash) and the allocated EEPROM backup per subsystem. Minimum and typical values assume all byte-writes to FlexRAM.

6.4.3 NFC specifications

The NAND flash controller (NFC) implements the interface to standard NAND flash memory devices. This section describes the timing parameters of the NFC.

In the following table:

- T_H is the flash clock high time and
- T_L is flash clock low time,

which are defined as:

$$T_{\text{NFC}} = T_L + T_H = \frac{T_{\text{input clock}}}{\text{SCALER}}$$

The SCALER value is derived from the fractional divider specified in the SIM's CLKDIV4 register:

$$\text{SCALER} = \frac{\text{SIM_CLKDIV4}[\text{NFCFRAC}] + 1}{\text{SIM_CLKDIV4}[\text{NFCDIV}] + 1}$$

In case the reciprocal of SCALER is an integer, the duty cycle of NFC clock is 50%, means $T_H = T_L$. In case the reciprocal of SCALER is not an integer:

$$T_L = (1 + \text{SCALER} / 2) \times \frac{T_{\text{NFC}}}{2}$$

$$T_H = (1 - \text{SCALER} / 2) \times \frac{T_{\text{NFC}}}{2}$$

For example, if SCALER is 0.2, then $T_H = T_L = T_{\text{NFC}}/2$.

However, if SCALER is 0.667, then $T_L = 2/3 \times T_{\text{NFC}}$ and $T_H = 1/3 \times T_{\text{NFC}}$.

NOTE

The reciprocal of SCALER must be a multiple of 0.5. For example, 1, 1.5, 2, 2.5, etc.

6.4.4 Flexbus Switching Specifications

All processor bus timings are synchronous; input setup/hold and output delay are given in respect to the rising edge of a reference clock, FB_CLK. The FB_CLK frequency may be the same as the internal system bus frequency or an integer divider of that frequency.

The following timing numbers indicate when data is latched or driven onto the external bus, relative to the Flexbus output clock (FB_CLK). All other timing relationships can be derived from these values.

6.6 Analog

6.6.1 ADC electrical specifications

The 16-bit accuracy specifications listed in [Table 28](#) and [Table 29](#) are achievable on the differential pins ADCx_DP0, ADCx_DM0.

The ADCx_DP2 and ADCx_DM2 ADC inputs are connected to the PGA outputs and are not direct device pins. Accuracy specifications for these pins are defined in [Table 30](#) and [Table 31](#).

All other ADC channels meet the 13-bit differential/12-bit single-ended accuracy specifications.

2. DC potential difference.
3. This resistance is external to MCU. The analog source resistance should be kept as low as possible in order to achieve the best results. The results in this datasheet were derived from a system which has $<8 \Omega$ analog source resistance. The R_{AS}/C_{AS} time constant should be kept to <1 ns.
4. To use the maximum ADC conversion clock frequency, the ADHSC bit should be set and the ADLPC bit should be clear.
5. For guidelines and examples of conversion rate calculation, download the ADC calculator tool: http://cache.freescale.com/files/soft_dev_tools/software/app_software/converters/ADC_CALCULATOR_CNV.zip?fp=1

1. Typical values assume V_{DDA} = 3.0 V, Temp = 25°C, f_{ADCK} = 6 MHz unless otherwise stated. Typical values are for reference only and are not tested in production.
2. ADC must be configured to use the internal voltage reference (VREF_OUT)
3. PGA reference is internally connected to the VREF_OUT pin. If the user wishes to drive VREF_OUT with a voltage other than the output of the VREF module, the VREF module must be disabled.
4. For single ended configurations the input impedance of the driven input is R_{PGAD}/2
5. The analog source resistance (R_{AS}), external to MCU, should be kept as minimum as possible. Increased R_{AS} causes drop in PGA gain without affecting other performances. This is not dependent on ADC clock frequency.
6. The minimum sampling time is dependent on input signal frequency and ADC mode of operation. A minimum of 1.25μs time should be allowed for F_{in}=4 kHz at 16-bit differential mode. Recommended ADC setting is: ADLSMP=1, ADLSTS=2 at 8 MHz ADC clock.
7. ADC clock = 18 MHz, ADLSMP = 1, ADLST = 00, ADHSC = 1
8. ADC clock = 12 MHz, ADLSMP = 1, ADLST = 01, ADHSC = 1

1. Typical values assume $V_{DDA} = 3.0\text{V}$, $\text{Temp} = 25^\circ\text{C}$, $f_{ADCK} = 6\text{MHz}$ unless otherwise stated.
2. This current is a PGA module adder, in addition to and ADC conversion currents.
3. Between $IN+$ and $IN-$. The PGA draws a DC current from the input terminals. The magnitude of the DC current is a strong function of input common mode voltage (V_{CM}) and the PGA gain.
4. $\text{Gain} = 2^{\text{PGAG}}$
5. After changing the PGA gain setting, a minimum of 2 ADC+PGA conversions should be ignored.

- Limit the input signal swing so that the PGA does not saturate during operation. Input signal swing is dependent on the PGA reference voltage and gain setting.

6.8.12 I2S/SAI Switching Specifications

This section provides the AC timing for the I2S/SAI module in master mode (clocks are driven) and slave mode (clocks are input). All timing is given for noninverted serial clock polarity (TCR2[BCP] is 0, RCR2[BCP] is 0) and a noninverted frame sync (TCR4[FSP]

is 0, RCR4[FSP] is 0). If the polarity of the clock and/or the frame sync have been inverted, all the timing remains valid by inverting the bit clock signal (BCLK) and/or the frame sync (FS) signal shown in the following figures.

Table 49. I2S/SAI master mode timing

Num.	Characteristic	Min.	Max.	Unit
	Operating voltage	1.71	3.6	V

1. The TSI module is functional with capacitance values outside this range. However, optimal performance is not guaranteed.
2. Fixed external capacitance of 20 pF.
3. The programmable current source value is generated by multiplying the SCANC[REFCHRG] value and the base current.
4. The programmable current source value is generated by multiplying the SCANC[EXTCHRG] value and the base current.
5. Measured with a 5 pF electrode, reference oscillator frequency of 10 MHz, PS = 128, NSCN = 8; I_{ext} = 16.
6. Measured with a 20 pF electrode, reference oscillator frequency of 10 MHz, PS = 128, NSCN = 2; I_{ext} = 16.
7. Measured with a 20 pF electrode, reference oscillator frequency of 10 MHz, PS = 16, NSCN = 3; I_{ext} = 16.
8. Sensitivity defines the minimum capacitance change when a single count from the TSI module changes, it is equal to (C_{ref} * I_{ext}) / (I_{ref} * PS * NSCN). Sensitivity depends on the configuration used. The typical value listed is based on the following configuration: I_{ext} = 5 μA, EXTCHRG = 4, PS = 128, NSCN = 2, I_{ref} = 16 μA, REFCHRG = 15, C_{ref} = 1.0 pF. The minimum sensitivity describes the smallest possible capacitance that can be measured by a single count (this is the best sensitivity but is described as a minimum because it's the smallest number). The minimum sensitivity parameter is based on the following configuration: I_{ext} = 1 μA, EXTCHRG = 0, PS = 128, NSCN = 32, I_{ref} = 32 μA, REFCHRG = 31, C_{ref} = 0.5 pF
9. Time to do one complete measurement of the electrode. Sensitivity resolution of 0.0133 pF, PS = 0, NSCN = 0, 1 electrode, EXTCHRG = 15.
10. REFCHRG=0, EXTCHRG=4, PS=7, NSCN=0F, LPSCNITV=F, LPO is selected (1 kHz), and fixed external capacitance of 20 pF. Data is captured with an average of 7 periods window.

8.2 K61 Pinouts

The below figure shows the pinout diagram for the devices supported by this document. Many signals may be multiplexed onto a single pin. To determine what signals can be used on which pin, see the previous section.

9 Revision History

The following table provides a revision history for this document.

Table 52. Revision History

Rev. No.	Date	Substantial Changes
1	6/2011	Initial public revision. Corrected USB conditions.

Table continues on the next page...

Table 52. Revision History (continued)

Rev. No.	Date	Substantial Changes
2	11/2011	• Added AC electrical specifications. • Updated Part identification section for 120 MHz CPU frequency. • Updated Voltage and current operating ratings section. • Updated Voltage and current operating requirements section. • Updated LVD and POR operating requirements section. • Updated Voltage and current operating behaviors section. • Updated Power mode transition operating behaviors section. • Updated Power consumption operating behaviors section. • In Run mode supply current vs. core frequency section, added Run and VLPR modes supply current vs. core frequency diagrams. • In Device clock specifications section, updated flash clock frequency and DDR clock frequency. • Updated Thermal attributes. • In MCG specifications section, updated total deviation of trimmed average DCO output Frequency, PLL reference frequency range, and lock detector detection time. • In Oscillator frequency specifications section, updated crystal startup time — 32 kHz. • Updated NFC specifications section. • In DryIce Tamper Electrical Specifications section, updated supply current. • In DSPI switching specifications section, updated master and slave modes frequency of operation for limited voltage and full voltage ranges. • In I2S/SAI Switching Specifications section, updated cycle time for master and slave modes. • In USB DCD electrical specifications section, updated data detect voltage. • In TSI electrical specifications, updated reference oscillator frequency. • Updated Pinouts. • Updated Pinouts.
