

512MB Unbuffered DDR SDRAM DIMM

EBD52UC8AAFA (64M words × 64 bits, 2 Ranks)

Description

The EBD52UC8AAFA is 64M words × 64 bits, 2 ranks Double Data Rate (DDR) SDRAM unbuffered module, mounting 16 pieces of 256M bits DDR SDRAM sealed in TSOP package. Read and write operations are performed at the cross points of the CK and the /CK. This high-speed data transfer is realized by the 2 bits prefetch-pipelined architecture. Data strobe (DQS) both for read and write are available for high speed and reliable data bus design. By setting extended mode register, the on-chip Delay Locked Loop (DLL) can be set enable or disable. This module provides high density mounting without utilizing surface mount technology. Decoupling capacitors are mounted beside each TSOP on the module board.

Features

- 184-pin socket type dual in line memory module (DIMM)
- PCB height: 31.75mm
- Lead pitch: 1.27mm
- 2.5V power supply
- Data rate: 266Mbps (max.)
- 2.5 V (SSTL_2 compatible) I/O
- Double Data Rate architecture; two data transfers per clock cycle
- Bi-directional, data strobe (DQS) is transmitted /received with data, to be used in capturing data at the receiver
- Data inputs and outputs are synchronized with DQS
- 4 internal banks for concurrent operation (Component)
- DQS is edge aligned with data for READs; center aligned with data for WRITEs
- Differential clock inputs (CK and /CK)
- DLL aligns DQ and DQS transitions with CK transitions
- Commands entered on each positive CK edge; data referenced to both edges of DQS
- Auto precharge option for each burst access
- Programmable burst length: 2, 4, 8
- Programmable /CAS latency (CL): 2, 2.5
- Refresh cycles: (8192 refresh cycles /64ms)
- 7.8μs maximum average periodic refresh interval
- 2 variations of refresh
- Auto refresh
- Self refresh

Ordering Information

Pin Description

Pin name	Function
A0 to A12	Address input Row address A0 to A12 Column address A0 to A9
BA0, BA1	Bank select address
DQ0 to DQ63	Data input/output
/RAS	Row address strobe command
/CAS	Column address strobe command
/WE	Write enable
/CS0, /CS1	Chip select
CKE0, CKE1	Clock enable
CK0 to CK2	Clock input
/CK0 to /CK2	Differential clock input
DQS0 to DQS7	Input and output data strobe
DM0 to DM7/DQS9 to DQS16	Input mask
SCL	Clock input for serial PD
SDA	Data input/output for serial PD
SA0 to SA2	Serial address input
VDD	Power for internal circuit
VDDSPD	Power for serial EEPROM
VREF	Input reference voltage
VSS	Ground
VDDID	VDD identification flag
NC	No connection

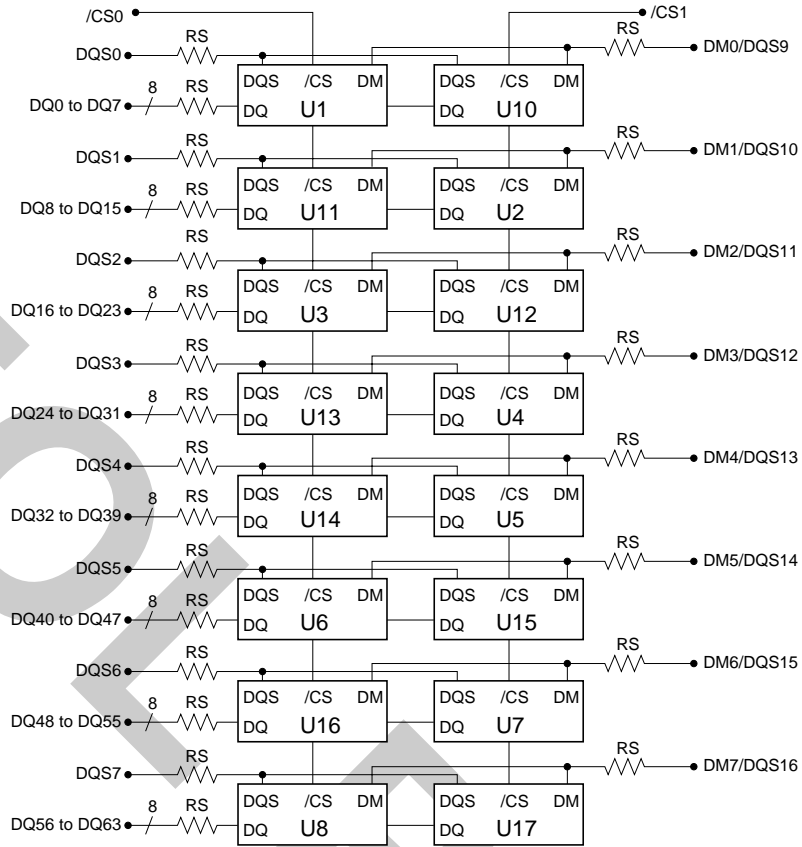

Serial PD Matrix

Byte No.	Function described	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	Hex value	Comments

Note: 1. These specifications are defined based on component specification, not module.

Block Diagram

* U1 to U8, U10 to U17: 256M bits DDR SDRAM
 U20: 2k bits EEPROM
 RS: 22Ω

Clock wiring

Clock input	DDR SDRAMS
CK0, /CK0	4DRAM loads
CK1, /CK1	6DRAM loads
CK2, /CK2	6DRAM loads

Note: Wire per Clock loading table/Wiring diagrams.

- A0 to A12 → A0 to A12 (U1 to U8, U10 to U17)
- BA0, BA1 → BA0, BA1 (U1 to U8, U10 to U17)
- /RAS → /RAS (U1 to U8, U10 to U17)
- /CAS → /CAS (U1 to U8, U10 to U17)
- /WE → /WE (U1 to U8, U10 to U17)
- CKE0 → CKE (U1 to U8, U10 to U17)
- CKE1 → CKE (U1 to U8, U10 to U17)

Notes:

1. The SDA pull-up resistor is required due to the open-drain/open-collector output.
2. The SCL pull-up resistor is recommended because of the normal SCL line inactive "high" state.

Logical Clock Net Structure

6DRAM loads

5DRAM loads

4DRAM loads

3DRAM loads

2DRAM loads

1DRAM loads

Electrical Specifications

- All voltages are referenced to VSS (GND).

Absolute Maximum Ratings

Parameter	Symbol	Value	Unit	Note
Voltage on any pin relative to VSS	VT	−0.5 to +3.6	V	
Supply voltage relative to VSS	VDD	−0.5 to +3.6	V	
Short circuit output current	IOS	50	mA	
Power dissipation	PD	16	W	
Operating ambient temperature	TA	0 to +70	°C	1
Storage temperature	Tstg	−40 to +100	°C	

Notes: 1. DDR SDRAM component specification.

Caution Exposing the device to stress above those listed in Absolute Maximum Ratings could cause permanent damage. The device is not meant to be operated under conditions outside the limits described in the operational section of this specification. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability.

DC Operating Conditions (TA = 0 to +70°C) (DDR SDRAM Component Specification)

Parameter	Symbol	Min	Typ	Max	Unit	Notes
Supply voltage	VDD,VDDQ	2.3	2.5	2.7	V	1
	VSS	0	0	0	V	
Input reference voltage	VREF	$0.49 \times VDDQ$	$0.50 \times VDDQ$	$0.51 \times VDDQ$	V	
Termination voltage	VTT	$VREF - 0.04$	VREF	$VREF + 0.04$	V	
Input high voltage	VIH (DC)	$VREF + 0.15$	—	$VDDQ + 0.3$	V	2
Input low voltage	VIL (DC)	−0.3	—	$VREF - 0.15$	V	3
Input voltage level, CK and /CK inputs	VIN (DC)	−0.3	—	$VDDQ + 0.3$	V	4
Input differential cross point voltage, CK and /CK inputs	VIX (DC)	$0.5 \times VDDQ - 0.2V$	$0.5 \times VDDQ$	$0.5 \times VDDQ + 0.2V$	V	
Input differential voltage, CK and /CK inputs	VID (DC)	0.36	—	$VDDQ + 0.6$	V	5, 6

Notes: 1. VDDQ must be lower than or equal to VDD.

2. VIH is allowed to exceed VDD up to 3.6V for the period shorter than or equal to 5ns.
3. VIL is allowed to outreach below VSS down to −1.0V for the period shorter than or equal to 5ns.
4. VIN (DC) specifies the allowable DC execution of each differential input.
5. VID (DC) specifies the input differential voltage required for switching.
6. VIH (CK) min assumed over $VREF + 0.18V$, VIL (CK) max assumed under $VREF - 0.18V$ if measurement.

DC Characteristics 1 (TA = 0 to +70°C, VDD = 2.5V ± 0.2V, VSS = 0V)

Parameter	Symbol	Grade	max.	Unit	Test condition	Notes
Operating current (ACTV-PRE)	IDD0		920	mA	CKE ≥ VIH, tRC = tRC (min.)	1, 2, 9
Operating current (ACTV-READ-PRE)	IDD1		1040	mA	CKE ≥ VIH, BL = 4, CL = 2.5, tRC = tRC (min.)	1, 2, 5
Idle power down standby current	IDD2P		288	mA	CKE ≤ VIL	4
Floating idle Standby current	IDD2F		480	mA	CKE ≥ VIH, /CS ≥ VIH DQ, DQS, DM = VREF	4, 5
Active power down standby current	IDD3P		360	mA	CKE ≤ VIL	3
Active standby current	IDD3N		600	mA	CKE ≥ VIH, /CS ≥ VIH tRAS = tRAS (max.)	3, 5, 6
Operating current (Burst read operation)	IDD4R		1440	mA	CKE ≥ VIH, BL = 2, CL = 2.5	1, 2, 5, 6
Operating current (Burst write operation)	IDD4W		1360	mA	CKE ≥ VIH, BL = 2, CL = 2.5	1, 2, 5, 6
Auto refresh current	IDD5		1360	mA	tRFC = tRFC (min.), Input ≤ VIL or ≥ VIH	
Self refresh current	IDD6		48	mA	Input ≥ VDD – 0.2 V Input ≤ 0.2 V	
Operating current (4 banks interleaving)	IDD7A		2120	mA	BL = 4	5, 6, 7

Notes. 1. These IDD data are measured under condition that DQ pins are not connected.

2. One bank operation.
3. One bank active.
4. All banks idle.
5. Command/Address transition once per one cycle.
6. Data/Data mask transition twice per one cycle.
7. 4 banks active. Only one bank is running at tRC = tRC (min.)
8. The IDD data on this table are measured with regard to tCK = tCK (min.) in general.
9. Command/Address transition once per one every two clock cycles.

DC Characteristics 2 (TA = 0 to +70°C, VDD, VDDQ = 2.5V ± 0.2V, VSS = 0V)

Parameter	Symbol	min.	max.	Unit	Test condition	Notes
Input leakage current	ILI	-32	32	μA	VDD ≥ VIN ≥ VSS	
Output leakage current	ILO	-10	10	μA	VDD ≥ VOUT ≥ VSS	
Output high current	IOH	-16.8	—	mA	VOUT = VTT + 0.84V	1
Output low current	IOL	16.8	—	mA	VOUT = VTT – 0.84V	1

Note: 1. DDR SDRAM component specification.

Pin Capacitance (TA = 25°C, VDD = 2.5V ± 0.2V)

Parameter	Symbol	Pins	max.	Unit	Notes
Input capacitance	CI1	Address, /RAS, /CAS, /WE, /CS, /CKE	120	pF	
Input capacitance	CI2	CK, /CK	85	pF	
Data and DQS input/output capacitance	CO	DQ, DQS	20	pF	

AC Characteristics (TA = 0 to +70°C, VDD, VDDQ = 2.5V ± 0.2V, VSS = 0V)**(DDR SDRAM Component Specification)**

Parameter	Symbol	min.	max	Unit	Notes
Clock cycle time (CL = 2)	tCK	10	15	ns	
(CL = 2.5)	tCK	7.5	15	ns	
CK high-level width	tCH	0.45	0.55	tCK	
CK low-level width	tCL	0.45	0.55	tCK	
CK half period	tHP	min (tCH, tCL)	—	tCK	
DQ output access time from CK, /CK	tAC	-0.75	0.75	ns	
DQS output access time from CK, /CK	tDQSK	-0.75	0.75	ns	
DQS to DQ skew	tDQSQ	—	0.5	ns	
DQ/DQS output hold time from DQS	tQH	tHP - 0.75	—	ns	
Data-out high-impedance time from CK, /CK	tHZ	-0.75	0.75	ns	1
Data-out low-impedance time from CK, /CK	tLZ	-0.75	0.75	ns	1
Read preamble	tRPRE	0.9	1.1	tCK	
Read postamble	tRPST	0.4	0.6	tCK	
DQ and DM input setup time	tDS	0.5	—	ns	
DQ and DM input hold time	tDH	0.5	—	ns	
DQ and DM input pulse width	tDIPW	1.75	—	ns	
Write preamble setup time	tWPRES	0	—	ns	3
Write preamble	tWPRE	0.25	—	tCK	
Write postamble	tWPST	0.4	0.6	tCK	2
Write command to first DQS latching transition	tDQSS	0.75	1.25	tCK	
DQS falling edge to CK setup time	tDSS	0.2	—	tCK	
DQS falling edge hold time from CK	tDSH	0.2	—	tCK	
DQS input high pulse width	tDQSH	0.35	—	tCK	
DQS input low pulse width	tDQSL	0.35	—	tCK	
Address and control input setup time	tIS	0.9	—	ns	6
Address and control input hold time	tIH	0.9	—	ns	6
Mode register set command cycle time	tMRD	15	—	ns	
Active to Precharge command period	tRAS	45	120000	ns	
Active to Active/Auto refresh command period	tRC	65	—	ns	
Auto refresh to Active/Auto refresh command period	tRFC	75	—	ns	
Active to Read/Write delay	tRCD	20	—	ns	
Precharge to active command period	tRP	20	—	ns	

Parameter	Symbol	min.	max	Unit	Notes
Active to active command period	tRRD	15	—	ns	
Write recovery time	tWR	15	—	ns	
Auto precharge write recovery and precharge time	tDAL	35	—	ns	
Internal write to Read command delay	tWTR	1	—	tCK	
Exit self refresh to non-read command	tXSNR	75	—	ns	
Exit self refresh to read command	tXSRD	200	—	tCK	
Exit power down to any non-read command	tXPNR	1	—	tCK	
Exit precharge power down to read command	tXPRD	1	—	tCK	5
Average periodic refresh interval	tREF	—	7.8	μs	4

Notes: 1 tHZ and tLZ transitions occur in the same access time windows as valid data transitions. These parameters are not referenced to a specific voltage level, but specify when the device output is no longer driving (HZ), or begins driving (LZ).

2. The maximum limit for this parameter is not a device limit. The device will operate with a greater value for this parameter, but system performance (bus turnaround) will degrade accordingly.
3. The specific requirement is that DQS be valid (High, Low, or at some point on a valid transition) on or before this CK edge. A valid transition is defined as monotonic, and meeting the input slew rate specifications of the device. When no writes were previously in progress on the bus, DQS will be transitioning from High-Z to logic Low. If a previous write was in progress, DQS could be High, Low, or transitioning from High to Low at this time, depending on tDQSS.
4. A maximum of eight auto refresh commands can be posted to any given DDR SDRAM device.
5. tXPRD should be 200 tCK in the condition of the unstable CK operation during the power down mode.
6. For command/address and CK and /CK slew rate $\geq 1.0V/ns$

Timing Parameter Measured in Clock Cycle for unbuffered DIMM

Parameter	Symbol	Number of clock cycle		Unit
		min.	max.	
Write to pre-charge command delay (same bank)	tWPD	3 + BL/2		tCK
Read to pre-charge command delay (same bank)	tRPD	BL/2		tCK
Write to read command delay (to input all data)	tWRD	2 + BL/2		tCK
Burst stop command to write command delay (CL = 2)	tBSTW	2		tCK
(CL = 2.5)	tBSTW	3		tCK
Burst stop command to DQ High-Z (CL = 2)	tBSTZ	2	2	tCK
(CL = 2.5)	tBSTZ	2.5	2.5	tCK
Read command to write command delay (to output all data) (CL = 2)	tRWD	2 + BL/2		tCK
(CL = 2.5)	tRWD	3 + BL/2		tCK
Pre-charge command to High-Z (CL = 2)	tHZP	2	2	tCK
(CL = 2.5)	tHZP	2.5	2.5	tCK
Write command to data in latency	tWCD	1	1	tCK
Write recovery	tWR	2		tCK
DM to data in latency	tDMD	0	0	tCK
Mode register set command cycle time	tMRD	2		tCK
Self refresh exit to non-read command	tSNR	75		tCK
Self refresh exit to read command	tSRD	200		tCK
Power down exit to command input	tPDEX	1		tCK

Pin Functions

CK, /CK (input pin)

The CK and the /CK are the master clock inputs. All inputs except DMs, DQSs and DQs are referred to the cross point of the CK rising edge and the VREF level. When a read operation, DQSs and DQs are referred to the cross point of the CK and the /CK. When a write operation, DMs and DQs are referred to the cross point of the DQS and the VREF level. DQSs for write operation are referred to the cross point of the CK and the /CK.

/CS (input pin)

When /CS is low, commands and data can be input. When /CS is high, all inputs are ignored. However, internal operations (bank active, burst operations, etc.) are held.

/RAS, /CAS, and /WE (input pins)

These pins define operating commands (read, write, etc.) depending on the combinations of their voltage levels. See "Command operation".

A0 to A12 (input pins)

Row address (AX0 to AX12) is determined by the A0 to the A12 level at the cross point of the CK rising edge and the VREF level in a bank active command cycle. Column address (AY0 to AY9) is loaded via the A0 to the A9 at the cross point of the CK rising edge and the VREF level in a read or a write command cycle. This column address becomes the starting address of a burst operation.

A10 (AP) (input pin)

A10 defines the precharge mode when a precharge command, a read command or a write command is issued. If A10 = high when a precharge command is issued, all banks are precharged. If A10 = low when a precharge command is issued, only the bank that is selected by BA1, BA0 is precharged. If A10 = high when read or write command, auto-precharge function is enabled. While A10 = low, auto-precharge function is disabled.

BA0, BA1 (input pin)

BA0, BA1 are bank select signals (BA). The memory array is divided into bank 0, bank 1, bank 2 and bank 3. (See Bank Select Signal Table)

[Bank Select Signal Table]

	BA0	BA1
Bank 0	L	L
Bank 1	H	L
Bank 2	L	H
Bank 3	H	H

Remark: H: VIH. L: VIL.

CKE (input pin)

CKE controls power down and self-refresh. The power down and the self-refresh commands are entered when the CKE is driven low and exited when it resumes to high.

The CKE level must be kept for 1 CK cycle at least, that is, if CKE changes at the cross point of the CK rising edge and the VREF level with proper setup time tIS, at the next CK rising edge CKE level must be kept with proper hold time tIH.

DQ (input and output pins)

Data are input to and output from these pins.

DQS (input and output pin)

DQS provide the read data strobes (as output) and the write data strobes (as input).

DM (input pins): DM is the reference signal of the data input mask function. DMs are sampled at the cross point of DQS and VREF

VDD (power supply pins)

2.5V is applied. (VDD is for the internal circuit.)

VDDSPD (power supply pin)

2.5V is applied (For serial EEPROM).

VSS (power supply pin)

Ground is connected.

Detailed Operation Part and Timing Waveforms

Refer to M2S56D20/30/40ATP datasheet.

Physical Outline

Unit: mm

Note: Tolerance on all dimensions ± 0.13 unless otherwise specified.

ECA-TS2-0040-01

CAUTION FOR HANDLING MEMORY MODULES

When handling or inserting memory modules, be sure not to touch any components on the modules, such as the memory ICs, chip capacitors and chip resistors. It is necessary to avoid undue mechanical stress on these components to prevent damaging them.

In particular, do not push module cover or drop the modules in order to protect from mechanical defects, which would be electrical defects.

When re-packing memory modules, be sure the modules are not touching each other.

Modules in contact with other modules may cause excessive mechanical stress, which may damage the modules.

MDE0202

NOTES FOR CMOS DEVICES**① PRECAUTION AGAINST ESD FOR MOS DEVICES**

Exposing the MOS devices to a strong electric field can cause destruction of the gate oxide and ultimately degrade the MOS devices operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it, when once it has occurred. Environmental control must be adequate. When it is dry, humidifier should be used. It is recommended to avoid using insulators that easily build static electricity. MOS devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work bench and floor should be grounded. The operator should be grounded using wrist strap. MOS devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with semiconductor MOS devices on it.

② HANDLING OF UNUSED INPUT PINS FOR CMOS DEVICES

No connection for CMOS devices input pins can be a cause of malfunction. If no connection is provided to the input pins, it is possible that an internal input level may be generated due to noise, etc., hence causing malfunction. CMOS devices behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using a pull-up or pull-down circuitry. Each unused pin should be connected to V_{DD} or GND with a resistor, if it is considered to have a possibility of being an output pin. The unused pins must be handled in accordance with the related specifications.

③ STATUS BEFORE INITIALIZATION OF MOS DEVICES

Power-on does not necessarily define initial status of MOS devices. Production process of MOS does not define the initial operation status of the device. Immediately after the power source is turned ON, the MOS devices with reset function have not yet been initialized. Hence, power-on does not guarantee output pin levels, I/O settings or contents of registers. MOS devices are not initialized until the reset signal is received. Reset operation must be executed immediately after power-on for MOS devices having reset function.

The information in this document is subject to change without notice. Before using this document, confirm that this is the latest version.

No part of this document may be copied or reproduced in any form or by any means without the prior written consent of Elpida Memory, Inc.

Elpida Memory, Inc. does not assume any liability for infringement of any intellectual property rights (including but not limited to patents, copyrights, and circuit layout licenses) of Elpida Memory, Inc. or third parties by or arising from the use of the products or information listed in this document. No license, express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of Elpida Memory, Inc. or others.

Descriptions of circuits, software and other related information in this document are provided for illustrative purposes in semiconductor product operation and application examples. The incorporation of these circuits, software and information in the design of the customer's equipment shall be done under the full responsibility of the customer. Elpida Memory, Inc. assumes no responsibility for any losses incurred by customers or third parties arising from the use of these circuits, software and information.

[Product applications]

Elpida Memory, Inc. makes every attempt to ensure that its products are of high quality and reliability. However, users are instructed to contact Elpida Memory's sales office before using the product in aerospace, aeronautics, nuclear power, combustion control, transportation, traffic, safety equipment, medical equipment for life support, or other such application in which especially high quality and reliability is demanded or where its failure or malfunction may directly threaten human life or cause risk of bodily injury.

[Product usage]

Design your application so that the product is used within the ranges and conditions guaranteed by Elpida Memory, Inc., including the maximum ratings, operating supply voltage range, heat radiation characteristics, installation conditions and other related characteristics. Elpida Memory, Inc. bears no responsibility for failure or damage when the product is used beyond the guaranteed ranges and conditions. Even within the guaranteed ranges and conditions, consider normally foreseeable failure rates or failure modes in semiconductor devices and employ systemic measures such as fail-safes, so that the equipment incorporating Elpida Memory, Inc. products does not cause bodily injury, fire or other consequential damage due to the operation of the Elpida Memory, Inc. product.

[Usage environment]

This product is not designed to be resistant to electromagnetic waves or radiation. This product must be used in a non-condensing environment.

If you export the products or technology described in this document that are controlled by the Foreign Exchange and Foreign Trade Law of Japan, you must follow the necessary procedures in accordance with the relevant laws and regulations of Japan. Also, if you export products/technology controlled by U.S. export control regulations, or another country's export control laws or regulations, you must follow the necessary procedures in accordance with such laws or regulations.

If these products/technology are sold, leased, or transferred to a third party, or a third party is granted license to use these products, that third party must be made aware that they are responsible for compliance with the relevant laws and regulations.
