February 1999

Revision History

Date	Remarks
Feb. 1999	Changes made on: CLKDEL register bit description.
Jan. 1999	New chip released: HFC-S PCI A is compliant to PCI Spec 2.2. The old chip
	HFC-S PCI is not recommended for new projects.
Sep. 1998	Changes made on: Electrical characteristics, Part List: C3 and C4 must be 22pF.
Aug. 1998	Changes made on: FIFO_EN register bit description.
Aug. 1998	Changes made on: Part List: C3 and C4 must be 47pF, C5 and C6 have been
	removed.
July 1998	changes made on: PCI buffer signaling and power supply environment, PCI
	configuration registers, B_MODE register bit description
July 1998	changes made on: Block diagram, sample circuitry, Part List: Q2 and Q3 must be
	BC850C instead of BC848B
June 1998	schematic of PCI sample board corrected; digital part added
May 1998	changes made on: RESET characteristics, PCI modes supported, PCI buffer
	signaling environment, PCI configuration registers, timer, FIFO counters location in
	MW, automatically D-channel frame repetition, FIFO initialisation, TRxR register
	bit description, CTMT register bit description, CHIP_ID register bit description,
	FIFO_EN register bit description, TRM register bit description, electrical
	characteristics, S/T module part numbers and manufacturers, sample circuitry

Features

- One chip ISDN-S-controller with B- and D-channel HDLC support
- O Independent Read and Write HDLC-Channels for 2 ISDN B-channels and one ISDN D-channel
- O B1- and B2-channel transparent mode independently selectable
- O FIFO-Memory-Window: 4x 7.5 KByte (B-channel) and 2x 512 Byte (D-channel)
- O max. 31 HDLC frames (B-channel) and 15 HDLC frames (D-channel) per channel and direction in FIFO
- O 56 kbit/s restricted mode for U.S. ISDN lines selectable
- O full I.430 ITU S/T ISDN support in TE and NT mode
- O B1+B2 HDLC mode
- O PCM30 interface configurable to interface MITEL STTM bus (MVIPTM), Siemens IOM2TM or GCITM for interface to U-chip or external codecs
- integrated PCI Spec. 2.1 bus interface for 3.3V and 5V bus signals
- O direct access to PCM30 interface for tone synthetisation
- O 3.3V and 5V supply voltage
- O rectangular QFP 100 case

1 General description

The HFC-S PCI is an ISDN S/T HDLC basic rate controller for so called "passive" ISDN PC cards with integrated S/T interface and PCM30 highway interface. It is the first all in one solution for a PCI ISDN PC-card world wide with power management and Windows 98 support.

A 32Kbyte memory window of the PC is used for the deep FIFOs. Also an industrial standard serial interface for telecom peripheral ICs is implemented. Codecs are normally connected to this interface.

1.1 Applications

O ISDN PCI PC card

2.9 Power supply

Pin No.	Pin Name	Function
7, 28, 48, 60, 76, 89	VDD	VDD (+3.3V or +5V)
8, 17, 29, 39, 49, 52, 61, 64, 77,	GND	GND
83, 90, 96		

d important!

All power supply pins VDD must be directly connected to each other. Also all pins GND must be directly connected to each other.

To keep VDD and GND bounce to a minimum a bypass capacitor (10 nF to 100 nF) should be placed between each pair of VDD/GND pins.

2.10 RESET characteristics

The reset signal (hardware reset or software reset) must be active for at least 4 clock cycles.

The GCI/IOM2 bus lines STIO1, STIO2 and the interrupt lines are in tristate mode after a reset.

The HFC-S PCI is in slave mode after reset. C4IO and F0IO are inputs.

The S/T state machine is stuck to '0' after reset. This means the HFC-S PCI does not react to any signal on the S/T interface before the S/T state machine is initialised.

The registers' initial values are described in the Register bit description (section 4 of this data sheet).

During initialisation phase the HFC-S PCI must not be accessed. Bit 1 of the STATUS register is cleared to '0' to indicate that the initialisation phase has been finished.

3 Functional description

3.1 PCI-interface

3.1.1 PCI access types used by HFC-S PCI

C/BE3#	C/BE2#	C/BE1#	C/BE0#	Command Type	HFC-S PCI mode
0	0	1	0	I/O Read	target mode
0	0	1	1	I/O Write	target mode
0	1	1	0	Memory Read	target mode and master mode
0	1	1	1	Memory Write	target mode and master mode
1	0	1	0	Configuration Read	target mode
1	0	1	1	Configuration Write	target mode

Table 1: PCI command types

3.1.2 PCI modes supported

The HFC-S PCI supports both target mode and master mode. Before the HFC-S PCI can operate in master mode the 32K Memory Window Base Address register (MWBA) must be configured. Afterwards all FIFO data accesses are done by the HFC-S PCI automatically by PCI master accesses. Only control and configuration register accesses must be done by PCI target accesses by the host CPU.

3.1.3 PCI buffer signaling and power supply environment

The HFC-S PCI supports 5V and 3.3V PCI bus environments. The environment mode is set during RESET (RST# low) by the input value of /ADR_WR.

PCI bus power and signaling environment	/ARD_WR during RST# low
3.3V	high *)
5V	low

^{*)} external pull-up resistor required (10k)

■ Register	Register is implemented, value can be read from EEPROM Register is implemented Register is not implemented and returns all 0's when read					

The external EEPROM is optional. If no EEPROM is available, EE_SCL/EN must be connected to GND. Without EEPROM the PCI configuration registers will be loaded with the default values shown in Table 2.

All registers which can be read from EEPROM can also be written by configuration write accesses. The addresses for configuration write are shown in the table below.

Register Name	Default Value	Remarks	
Vendor ID	1397h	Value can be read from EEPROM. Base address for	
		configuration write is C0h.	
Device ID	2BD0h	Value can be read from EEPROM. Base address for	
		configuration write is C0h.	
Command Register		Bits Function	
		0 Enables/disables I/O space accesses.	
		1 Enables/disables memory space accesses.	
		2 Enables/disables master accesses.	
		53 fixed to '0'	
		6 PERR # enable/disable	
		7 fixed to '0'	
		8 SERR# enable/disable	
		159 fixed to '0'	
Status Register	0210h	Bits[7:0] can be read from EEPROM. Base address for	
		configuration write is C4h.	
		Bits Function	
		30 reserved	
		4 fixed to '1'	
		5 66MHz capable	
		6 User definable features supported	
		7 fast Back-to-Back capable	
		8 data parity error detected	
		109 fixed to '01': timing of DEVSEL# is medium	
		signaled target abort (fixed to '0')	
		received target abort	
		received master abort	
		signaled system error (Addr. parity error)	
		15 detected partity error	
Revision ID	01h		
Class Code	02 80 00h	Value can be read from EEPROM. Base address for	
		configuration write is C8h.	
Latency Timer	10h	Set to 16 clocks, value is fixed.	
Header Type	00h	Header Type 0	
BIST	00h	No build in self test supported.	
I/O Base Address		Bits[31:3] are r/w by configuration accesses	
Memory Base Address		Bits[31:8] are r/w by configuration accesses	
Subsystem Vendor ID	1397h	Value can be read from EEPROM. Base address for	
		configuration write is ECh.	
Subsystem ID	2BD0h	Value can be read from EEPROM. Base address for	
		configuration write is ECh.	
Cap_Ptr	40h	Offset to Power Management register block.	

February 1999 15 of 64

Register Name	Default Value	Remarks	
Interrupt Line	FFh	This register must be configured by configuration write.	
Interrupt Pin	01h	INTA supported	
Min_Gnt	00h	Value can be read from EEPROM. Base address for	
		configuration write is FCh.	
Max_Lat	10h	Value can be read from EEPROM. Base address for	
		configuration write is FCh.	
Cap_ID	01h	Capability ID. 01h identifies the linked list item as PCI	
•		Power Management registers.	
Next Ptr	00h	There are no next items in the linked list.	
PMC	7E21h	Power Management Capabilities. See also PCI Bus	
		Power Management Interface Specification. This	
		register's value can be read from EEPROM. Base	
		address for configuration write is E0h.	
		PME # can be asserted from D0, D1, D2 and D3 _{hot} .	
		Device specific initialisation is required.	
		The HFC-S PCI does not require PCI-clock to generate	
		PME# (if S/T change state is selected).	
		This function complies with the PCI Power	
		Management Spec. Version 1.0.	
PMCSR	0000h	Power Management Control/Status	
		Bits Function	
		PME_Status - This bit is set when the function	
		would normally assert the PME# signal	
		independent of the state of the PME_En bit.	
		Writing a '1' to this bit will clear it and cause	
		the function to stop asserting a PME # (if	
		enabled).	
		Writing a '0' has no effect.	
		149 fixed to '0'	
		8 PME_En - A '1' enables the function to assert	
		PME#.	
		When '0', PME # assertion is disabled. 72 fixed to '0'	
		10 PowerState - This 2-bit field is used both to	
		determine the current power state of a function	
		and to set the function into a new power state.	
		and to set the function into a new power state.	
		00b - D0	
		01b - DI	
		10b - D 2	
		11b - D3 _{hot}	
		not	
		All States except D0 disable HFC-S PCI master	
		accesses.	

Register Name	Default Value	Remarks
32K Memory Window	0000h	Bits[31:15] are r/w by configuration accesses.
Base Address		The 32K Memory Window is for HFC-S PCI internal
(MWBA)		use and for the B- and D-channel FIFOs. This register
		must be written by a "DWORD Config Write" to enable
		the HFC-S PCI to operate in master mode.

Table 2: PCI configuration registers' initial values

Unimplemented registers return all 0's when read.

3.2 Internal HFC-S PCI register description

If the HFC-S PCI is used in memory mapped mode all register can directly be accessed by adding their CIP address to the configured Memory Base Address.

In I/O address mapped mode the HFC-S PCI occupies 8 bytes in the I/O address space. Byte 0 is for data read/write, byte 4 for register selection. The AUX-port address is selected by byte 3, AUX-port data is read/written by byte 1.

I/O-Address	Byte 3	Byte 2	Byte 1	Byte 0
	AUX-Addr.		AUX-Data	Data
I/O-Address	Byte 7	Byte 6	Byte 5	Byte 4
	AUX-Addr.		AUX-Data	Register Select

3.2.1 Registers of the S/T section

CIP / I/O-address		Name	r/w	Function	
	1100 0000	C0h	STATES	r/w	State of the TE/NT state machine
	1100 0100	C4h	SCTRL	w	S/T control register
	1100 1000	C8h	SCTRL_E	W	S/T control register (extended)
	1100 1100	CCh	SCTRL_R	W	receive enable for B-channels
	1101 0000	D0h	SQ_REC SQ_SEND	r w	receive register for S/Q bits send register for S/Q bits
	1101 1100	DCh	CLKDEL	W	setup of the delay time between receive and send direction (TE) receive data sample time (NT)
	1111 0000	F0h	B1_REC*) B1_SEND*)	r w	B1-channel receive register B1-channel transmit register
	1111 0100	F4h	B2_REC*) B2_SEND*)	r w	B2-channel receive register B2-channel transmit register
	1111 1000	F8h	D_REC*) D_SEND*)	r w	D-channel receive register D-channel transmit register
	1111 1100	FCh	E_REC*)	r	E-channel receive register

These registers are read/written automatically by the HDLC FIFO controller (HFC) or GCI/IOM2 bus controller and need not be accessed by the user. To read/write data the FIFOs in the Memory Window should be used.

3.2.2 Registers of the GCI/IOM2 bus section

GCI/IOM2 bus timeslot selection registers

CIP / I/O-address		Name r/w	Function	
0000 1000	08h	C/I	r/w	C/I command/indication register
0000 1100	0Ch	TRxR	r	Monitor Tx ready handshake
0010 1000	28h	MON1_D	r/w	first monitor byte second monitor byte
0010 1100	2Ch	MON2_D	r/w	

GCI/IOM2 bus timeslot selection registers

CIP / I/O-ad	ldress	Name	r/w	Function		
1000 0000	80h	B1_SSL	w	B1-channel transmit slot (031)		
1000 0100	84h	B2_SSL	w	B2-channel transmit slot (031)		
1000 1000	88h	AUX1_SSL	w	AUX1-channel transmit slot (031)		
1000 1100	8Ch	AUX2_SSL	w	AUX2-channel transmit slot (031)		
1001 0000	90h	B1_RSL	w	B1-channel receive slot (031)		
1001 0100	94h	B2_RSL	w	B2-channel receive slot (031)		
1001 1000	98h	AUX1_RSL	w	AUX1-channel receive slot (031)		
1001 1100	9Ch	AUX2_RSL	w	AUX2-channel receive slot (031)		

GCI/IOM2 bus data registers

0111 0000	70h	STATUS	r	common status register

3.3 Timer

The HFC-S PCI includes a timer with interrupt capability. The timer counts F0IO pulses. So the timer counter is incremented every $125\mu s$. It can be reset by bit 7 of of the CTMT register. Furthermore the timer is reset at every HFC-S PCI access when bit 5 of the CTMT register is set. Seven different timer values can be selected.

February 1999 21 of 64

3.4 FIFOs

All FIFOs are located in the 32K Memory Window (MW) in host PC's memory.

There are 6 FIFOs with 6 HDLC-Controllers handled by the HFC-S PCI. The HDLC circuits are located on the S/T device side of the HFC-S PCI. So always plain data is stored in the FIFO. Zero insertion and deletion is done in HDLC mode:

- if the data goes to the S/T or GCI/IOM device in send FIFOs and
- when the HDLC data comes from the S/T device or GCI/IOM2 bus in receive operation.

There are a send and a receive FIFO for each of the two B-channels and for the D-channel.

The FIFOs are realized as ring buffers in the 32K Memory Window in host PC's memory. To control them there are some counters.

		B-channel	D-channel
Z1: I	FIFO input counter	13 Bit	9 Bit
Z2: I	FIFO output counter	13 Bit	9 Bit

Each counter points to a byte position in the Memory Window. This is an offset to the 32K Memory Window Base Address in the configuration space. On a FIFO input operation Z1 is incremented. On an output operation Z2 is incremented.

After every pulse on the F0IO signal two HDLC-bytes are written into the S/T interface (FIFOs No. 0 and 2) and two HDLC-bytes are read from the S/T interface (FIFOs No. 1 and 3). D-channel data is handled in a similar way but only 2 bits are processed.

d important!

Instead of the S/T interface also GCI/IOM2 bus is selectable for each B-channel (see CONNECT register).

If Z1 = Z2 the FIFO is empty.

Additionally there are two counters F1 and F2 for every FIFO channel (5Bit for B-channel, 4Bit for D-channel). They count the HDLC-frames in the FIFOs and form a ring buffer as Z1 and Z2 do, too.

F1 is incremented when a complete frame has been received and stored in the FIFO. F2 is incremented when a complete frame has been read from the FIFO.

If F1 = F2 there is no complete frame in the FIFO.

When the RESET line is active or software reset is active Z1, Z2, F1 and F2 are all initialized to all 1s.

All Zx and Fx counters are also stored in the Memory Window. So it is easy to read and write the counters by simple host memory accesses.

Because the HFC-S PCI is limited to the 32K Memory Window data in different regions of the host PC can not be overwritten even if counter and pointer values are handled in a wrong way.

d important!

The counter state 0200h of the Z-counters follows counter state 1FFFh in the B-channel FIFOs. The counter state 000h of the Z-counters follows counter state 1FFh in the D-channel FIFOs.

The counter state 00h of the F-counters follows counter state 1Fh in the B-channel FIFOs. The counter state 10h of the F-counters follows counter state 1Fh in the D-channel FIFOs.

3.4.1 FIFO counters location in Memory Window

For each FIFO one F1 and one F2 counter is available. The counters are located at the following offsets to the Memory Window Base Address (MWBA) in the Memory Window (MW).

FIFO	Counter	Offset to Memory Window Base Address	Counter Size in Bytes
B1-transmit	F1	2080h	1
	F2*)	2081h	1
B1-receive	F1*)	6080h	1
	F2	6081h	1
B2-transmit	F1	2180h	1
	F2*)	2181h	1
B2-receive	F1*)	6180h	1
	F2	6181h	1
D-transmit	F1	20A0h	1
	F2*)	20A1h	1
D-receive	F1*)	60A0h	1
	F2	60A1h	1

^{*)} These counters are handled by the HFC-S PCI automatically and must not be written by software.

February 1999 23 of 64

For each FIFO an array of Z1 and Z2 counters is available. The offset of the counters to the Memory Window Base Address (MWBA) can be calculated as shown in the following table.

FIFO	Counter	Offset to Memory Window Base Address	Counter Size in Bytes
B1-transmit	Z1	2000h + (Fx * 4)	2
	$Z2^{*)}$	2000h + (Fx * 4) + 2	2
B1-receive	Z1*)	6000h + (Fx * 4)	2
	Z 2	6000h + (Fx * 4) + 2	2
B2-transmit	Z1	2100h + (Fx * 4)	2
	Z2*)	2100h + (Fx * 4) + 2	2
B2-receive	Z1*)	6100h + (Fx * 4)	2
	Z 2	6100h + (Fx * 4) + 2	2
D-transmit	Z1	2080h + (Fx * 4)	2
	$Z2^{*)}$	2080h + (Fx * 4) + 2	2
D-receive	Z1*)	6080h + (Fx * 4)	2
	Z2	6080h + (Fx * 4) + 2	2

^{*)} These counters are handled by the HFC-S PCI automatically and must not be written by software.

Fx is either F1 or F2. F1 is used for input data in transmit FIFOs, F2 is used for output data in receive FIFOs.

3.4.2 FIFO data location in Memory Window

FIFO	Starting at Offset	Ending at Offset	Offset to add to Z-counters value
B1-transmit	0200h	1FFFh	0000h
B1-receive	4200h	5FFFh	4000h
B2-transmit	2200h	3FFFh	2000h
B2-receive	6200h	7FFFh	6000h
D-transmit	0000h	01FFh	0000h
D-receive	4000h	41FFh	4000h

2564 Fyl 1929 or

3.4.3 FIFO channel operation

Figure 5: FIFO Organisation (shown for B-channel, similar for D-channel)

3.4.3.1 Send channels (B1, B2 and D transmit)

The send channels send data from the host bus interface to the FIFO and the HFC-S PCI converts the data into HDLC code and transfers it from the FIFO into the S/T or/and the GCI/IOM2 bus interface write registers.

The HFC-S PCI checks Z1 and Z2. If Z1=Z2 (FIFO empty) the HFC-S PCI generates a HDLC-Flag (01111110) and sends it to the S/T device. In this case Z2 is not incremented. If also F1=F2 only HDLC flags are sent to the S/T interface and all counters remain unchanged. If the frame counters are unequal F2 is incremented and the HFC-S PCI tries to send the next frame to the output device. After the end of a frame (Z2 reaches Z1) it automatically generates the 16 bit CRC checksum and adds the ending flag. If there is another frame in the FIFO (F1≠F2) the F2 counter is incremented.

With every byte being sent from the host bus side to the FIFO Z1 is incremented automatically. If a complete frame has been sent F1 must be incremented to send the next frame. If the frame counter F1 is incremented also the Z-counters may change because Z1 and Z2 are functions of F1 and F2. So there are Z1(F1), Z2(F1), Z1(F2) and Z2(F2) (see Figure 5).

Z1(F1) is used for the frame which is just written from the PC-bus side. Z2(F2) is used for the frame which is just beeing transmitted to the S/T device side of the HFC-S PCI. Z1(F2) is the end of frame pointer of the current output frame.

February 1999 25 of 64

In the send channels F1 is only changed from the PC interface side if the software driver wants to say "end of send frame". Then the current value of Z1 is stored, F1 is incremented and Z1 is used as start address of the next frame, Z1(F2) and Z2(F2) can not be accessed.

3.4.3.2 Automatically D-channel frame repetition

The D-channel send FIFO has a special feature. If the S/T interface signals a D-channel contention before the CRC is sent the Z2 counter is set to the starting address of the current frame and the HFC-S PCI tries to repeat the frame automatically.

d important!

The HFC-S PCI begins to transmit bytes from a FIFO at the moment $Z1 \neq Z2$. So if the Z1 pointer is updated by software after writing the transmit data into the FIFO space of the Memory Window the transmission starts.

3.4.3.3 FIFO full condition in send channels

FIFO full condition can easily be calculated from the Z1/Z2 table in the Memory Window.

Remember that an increment of Z-value 1FFFh is 0200h in the B-channels!

There are two different FIFO full conditions. The first one is met when the FIFO contents comes up to 31 frames (B-channel) or 15 frames (D-channel). There is no possibility for the HFC-S PCI to manage more frames even if the frames are very small.

The second limitation is the size of the FIFO which is 512 byte for the D-channel and 7.5 KByte for the B-channels.

3.4.3.4 Receive Channels (B1, B2 and D receive)

The receive channels receive data from the S/T or GCI/IOM2 bus interface read registers. The data is converted from HDLC into plain data and sent to the FIFO. The data can then be read via the host bus interface.

The HFC-S PCI checks the HDLC data coming in. If it finds a flag or more than 5 consecutive 1s it does not generate any output data. In this case Z1 is not incremented. Proper HDLC data being received is converted by the HFC-S PCI into plain data. After the ending flag of a frame the HFC-S PCI checks the HDLC CRC checksum. If it is correct one byte with all 0s is inserted behind the CRC data in the FIFO named STAT. This last byte of a frame in the FIFO is different from all 0s if there is no correct CRC field at the end of the frame.

Figure 6: FIFO Data Organisation

The ending flag of a HDLC-frame can also be the starting flag of the next frame.

After a frame is received completely F1 is incremented by the HFC-S PCI automatically and the next frame can be received.

After reading a frame via the host bus interface F2 must be incremented. If the frame counter F2 is incremented also the Z-counters may change because Z1 and Z2 are functions of F1 and F2. So there are Z1(F1), Z2(F1), Z1(F2) and Z2(F2) (see Figure 5).

Z1(F1) is used for the frame which is just received from the S/T device side of the HFC. Z2(F2) is used for the frame which is just beeing transmitted to the host bus interface. Z1(F2) is the end of frame pointer of the current output frame.

To calculate the length of the current receive frame the software has to evaluate Z1-Z2+1.

In the receive channels F2 must be incremented to point to the next Z1/Z2 pair. If Z1 = Z2 and F1 = F2 the FIFO is totally empty.

February 1999 27 of 64

3.4.3.5 FIFO full condition in receive channels

Because the ISDN-B-channels and the ISDN-D-channels have no hardware based flow control there is no possibility to stop input data if a receive FIFO is full.

So there is no FIFO full condition implemented in the HFC-S PCI. The HFC-S PCI assumes that the FIFOs are so deep that the host processor hard- and software is able to avoid any overflow of the receive FIFOs. Overflow conditions are again more than 31 input frames (15 frames for D-channel) or a real overflow of the FIFO because of excessive data.

Because HDLC procedures only know a window size of 7 frames no more than 7 frames are sent without software intervention. Due to the great size of the FIFOs of the HFC-S PCI it is easy to poll counters in the Memory Window even in large time intervalls without having to fear a FIFO overflow condition.

However to avoid any undetected FIFO overflows the software driver should check the number of frames in the FIFO which is F1-F2. An overflow exists if the number (F1-F2) is less than the number in the last reading even if there was no reading of a frame in between.

After a detected FIFO overflow condition this FIFO must be reset.

3.4.3.6 FIFO initialisation

All counters Z1, Z2, F1 and F2 of all FIFOs are initialized to all 1s after a RESET.

Then the result is Z1 = Z2 = 1FFFh and F1 = F2 = 1Fh for the B-channels and Z1 = Z2 = 1FFh and F1 = F2 = 1Fh for the D-channel. This information is written in the Memory Window for initialisation.

Please mask bit 4 of D-channel from counter F1, F2.

The same initialisation is done if the bit 3 in the CIRM register is set (soft reset).

During initialisation phase the HFC-S PCI must not be accessed. Bit 1 of the STATUS register is cleared to '0' to indicate that the initialisation phase has been finished.

3.4.4 Transparent mode of HFC-S PCI

You can switch off HDLC operation for each B-channel independently. There is one bit for each B-channel in the CTMT control register. If this bit is set data in the FIFO is sent directly to the S/T or GCI/IOM2 bus interface and data from the S/T or GCI/IOM2 bus interface is sent directly to the FIFO.

Be sure to switch into transparent mode only if F1=F2. Being in transparent mode the Fx counters remain unchanged. Z1 and Z2 are the input and output pointers respectively. Because F1=F2 both Z-counters are always accessable and have valid data.

If a send FIFO channel changes to FIFO empty condition no CRC is generated and the last data byte written into the FIFO is repeated until there is new data.

In receive channels there is no check on flags or correct CRCs and no status byte is added.

The byte bounderies are not arbitrary like in HDLC mode where byte synchronisation is achieved with HDLC-flags. The data is just the same as it comes from the S/T or GCI/IOM2 bus interface or is sent to this.

Send and receive transparent data can be handled in two ways. The usual way is transmitting B-channel data with the LSB first as it is usual in HDLC mode. The second way is sending the bytes in reverse bit order as it is usual for PWM data. So the first bit is the MSB. The bit order can be reversed by setting the corresponding bits in the CIRM register.

4 Register bit description

4.1 Register bit description of S/T section

Name	Addr.	Bits	r/w	Function
STATES	C0h	30	r	binary value of actual state (NT: Gx, TE: Fx)
			W	prepare for new state xxxx
		4	W	'1' loads the prepared state (bit 30) and stops the state
				machine. This bit needs to be set for a minimum period of
				5.21µs and must be cleared by software.
				(reset default)
				'0' enables the state machine.
				After writing an invalid state the state machine goes to
				deactivated state (G1, F2)
		5	W	'0' prepare deactivation
				'1' prepare activation
		6	W	'1' start activation/deactivation as selected by bit 5
				This bit is automatically cleared after activation/deactivation.
		7	W	'0' no operation
				'1' in NT mode allows transition from G2 to G3.
				This bit is automatically cleared after the transition.

d important!

The state machine is stuck to '0' after a reset. Writing a '0' to bit 4 of the STATES register restarts the state machine.

In this state the HFC-S PCI sends no signal on the S/T-line and it is not possible to activate it by incoming INFOx.

NT mode: The NT state machine does not change automatically from G2 to G3 if the TE side sends INFO3 frames. This transition must be activated each time by bit 7 of the STATES register.

Addr.	Bits	r/w	Function
C4h			B-channel enable
	0	W	'0' B1 send data disabled (permanent 1 sent in activated
			states, reset default)
			'1' B1 data enabled
	1	W	'0' B2 send data disabled (permanent 1 sent in activated
			states, reset default)
			'1' B2 data enabled
	2	W	S/T interface mode
			'0' TE mode (reset default)

		7	w	unused
			1	Language and the control of the cont

d note!

The register is not initialized with a '0' after reset. The register should be initialized as follows before activating the TE/NT state machine:

TE mode: 0Dh .. 0Fh NT mode: 6Ch

4.2 Register bit description of GCI/IOM2 bus section

Timeslots for transmit direction

Name	Addr.	Bits	r/w	Function
B1_SSL	80h	40	W	select GCI/IOM2 bus transmission slot (031)
B2_SSL	84h	5	W	unused
AUX1_SSL	88h	6	W	select GCI/IOM2 bus data lines
AUX2_SSL	8Ch			'0' STIO1 output
				'1' STIO2 output
		7	W	transmit channel enable for GCI/IOM2 bus
				'0' disable (reset default)
				'1' enable

d important!

Enabling more than one channel on the same slot causes undefined output data.

Timeslots for receive direction

Name	Addr.	Bits	r/w	Function
B1_RSL	90h	40	W	select GCI/IOM2 bus receive slot (031)
B2_RSL	94h	5	W	unused
AUX1_RSL	98h	6	W	select GCI/IOM2 bus data lines
AUX2_RSL	9Ch			'0' STIO2 is input
				'1' STIO1 is input
		7	W	receive channel enable for GCI/IOM2 bus
				'0' disable (reset default)
				'1' enable

Data registers

Name	Addr.	Bits	r/w	Function
B1_D	A0h	07	r/w	read/write data registers for selected timeslot data
B2_D	A4h			
AUX1_D	A8h			
AUX2_D	ACh			

d note!

If the data registers AUX1_D and AUX2_D are not overwritten, the transmisson slots AUX1_SSL and AUX2_SSL mirror the data received in AUX1_RSL and AUX2_RSL slots. This is useful for an internal connection between two CODECs. This mirroring is disabled by setting bit 1 in MST_EMOD register

February 1999 33 of 64

Name	Addr.	Bits	r/w	Function
MST_MODE	B8h	0	W	GCI/IOM2 bus mode
				'0' slave (reset default) (C4IO and F0IO are inputs)
				'1' master (C4IO and F0IO are outputs)
		1	W	polarity of C4- and C2O-clock
				'0' F0IO is sampled on negative clock transition
				'1' F0IO is sampled on positive clock transition
		2	W	polarity of F0-signal
				'0' F0 positive pulse
				'1' F0 negative pulse
		3	W	duration of F0-signal
				'0' F0 active for one C4-clock (244ns) (reset default)
				'1' F0 active for two C4-clocks (488ns)
		5, 4	W	time slot for codec-A signal F1_A
				'00' B1 receive slot
				'01' B2 receive slot
				'10' AUX1 receive slot
				'11' signal C2O → pin F1_A (C2O is 2048 kHz clock)
		7, 6	W	time slot for codec-B signal F1_B
				'00' B1 receive slot
				'01' B2 receive slot
				'10' AUX1 receive slot
				'11' AUX2 receive slot

The pulse shape and polarity of the codec signals F1_A and F1_B is the same as the pulseshape of the F0IO signal. The polatity of C2O can be changed by bit 1.

RESET sets register MST_MODE to all '0's.

Name	Addr.	Bits	r/w	Function
MST_EMOD	B4h	0	W	slow down C4IO clock adjustment (see Figure 17)
				'0' C4IO clock is adjusted in the 31th time slot twice for one
				half clock cycle (reset default)
				'1' C4IO clock is adjusted in the 31th time slot once for one
				half clock cycle
		1	W	enable/disable AUX channel mirroring
				'0' normal opration (reset default)
				'1' disable AUX channel data mirroring
		2	W	unused
		53	W	select D-channel data flow (see also: CONNECT register)
				destination source
				bit 3: '0' D-HFC \leftarrow D-S/T
				'1' D-HFC ← D-GCI/IOM2
				bit 4: $'0'$ D-S/T \leftarrow D-HFC
				'1' D-S/T \leftarrow D-GCI/IOM2
				bit 5: '0' D-GCI/IOM2 ← D-HFC
				'1' D-GCI/IOM2 ← D-S/T
		6	W	unused
		7	W	enable GCI/IOM2 write slots
				'0' disable GCI/IOM2 write slots; slot #2 and slot #3 may be
				used for normal data
				'1' enables slot #2 and slot #3 as master, D- and C/I-channel
C/I	08h	30	r/w	on read: indication
				on write: command
		74		unused
TRxR	0Ch	0	r	'1' monitor receive ready (2 bytes received)
				This bit is reset after read of second monitor byte (MON2_D)
		1	r	'1' Monitor transmitter ready
				Writing on MON2_D starts transmisssion and resets this bit.
		52	r	reserved
		6	r	STIO2 in
		7	r	STIO1 in

RESET sets register MST_EMOD to all '0's.

February 1999 35 of 64

4.3 Register bit description of CONNECT register

Name	Addr.	Bits	r/w	Function
CONNECT	BCh	20	W	select B1-channel data flow
				destination source
				bit 0: '0' B1-HFC \leftarrow B1-S/T
				'1' B1-HFC ← B1-GCI/IOM2
				bit 1: '0' B1-S/T ← B1-HFC
				'1' B1-S/T ← B1-GCI/IOM2
				bit 2: '0' B1-GCI/IOM2 ← B1-HFC
				'1' B1-GCI/IOM2 ← B1-S/T
		53	W	select B2-channel data flow
				destination source
				bit 3: '0' B2-HFC \leftarrow B2-S/T
				'1' B2-HFC ← B2-GCI/IOM2
				bit 4: '0' B2-S/T \leftarrow B2-HFC
				'1' B2-S/T ← B2-GCI/IOM2
				bit 5: '0' B2-GCI/IOM2 ← B2-HFC
				'1' B2-GCI/IOM2 ← B2-S/T
		76	W	unused

RESET sets CONNECT register to all '0's.

The following figure shows the different options for switching the B-channels with the CONNECT register.

Figure 7: Function of the CONNECT register bits

4.4 Register bit description of auxiliary and cross data registers

Name	Addr.	Bits	r/w	Function
CIRM	60h	20	W	defines the length of the auxiliary port access:
				Value Cycle time (AUX_WR or AUX_RD low)
				000b 1 PCI-Clock
				001b 3 PCI-Clocks
				010b 5 PCI-Clocks
				011b 7 PCI-Clocks
				100b 9 PCI-Clocks
				101b 11 PCI-Clocks
				110b 13 PCI-Clocks
				111b 15 PCI-Clocks
		3	W	soft reset, similar as hardware reset; the registers CIP, CIRM
				and CTMT are not changed. The PCI interface is not reset.
				The reset is active until the bit is cleared.
				'0' deactivate reset (reset default)
				'1' activate reset
		54	W	must be '0'
		6	W	select bit order for B1 channel
				'0' normal read/write data operation
				'1' reverse bit order read/write data operation
		7	W	select bit order for B2 channel
				'0' normal read/write data operation
				'1' reverse bit order read/write data operation
FIFO_EN	44h	50	W	FIFO enable/disable ('1' = enable (reset default))
				Bit FIFO
				0 B1-transmit
				1 B1-receive
				2 B2-transmit
				3 B2-receive
				4 D-transmit
				5 D-receive
				The enable/disable change becomes valid between 0 and
				250µs after the bit has been written. All PCI bus accesses and
				FIFO activities are disabled for the selected FIFOs. To avoid
				unnecessary PCI transfers all unused FIFOs should be disabled.
		76	***	At least one FIFO (usually D-receive) must be enabled. unused, should be '0'
	1	70	W	unuscu, should be o

				'1' interrupt as selected in TRM register bits 10			
		2	r	D-channel interrupt status in transmit direction			
				'1' a complete frame was transmitted, the frame counter			
				F2 was incremented			
		3	r	B1-channel interrupt status in receive direction			
		4	r	B2-channel interrupt status in receive direction			
				in HDLC mode:			
				'1' a complete frame has been transmitted, the frame counter			
				F1 has been incremented			
				in transparent mode:			
				'1' interrupt as selected in TRM register bits 10			
		5	r	D-channel interrupt status in receive direction			
				'1' a complete frame was received, the frame counter			
				F1 was incremented			
		6	r	TE/NT state machine interrupt status			
				'1' state of state machine changed			
		7	r	timer interrupt status			
				'1' timer is elapsed			
INT_S2	7Ch	0	r	processing/non processing transition interrupt status			
				'1' The HFC-S PCI has changed from processing to non			
				processing state.			
		1	r	GCI I-change interrupt			
				'1' a different I-value on GCI was detected			
		2	r	receiver ready (RxR) of monitor channel			
				'1' 2 monitor bytes have been received			
		63	r	unused, '0'			
		7	r	'1' fatal error: synchronisation lost. PCI performance too low			
				for HFC-S PCI. Only soft reset recovers from this situation.			

d important!

Reading the INT_S1 or INT_S2 register resets all active read interrupts in the INT_S1 or INT_S2 register. New interrupts may occur during read. These interrupts are reported at the next read of INT_S1 or INT_S2.

All interrupt bits are reported regardless of the mask registers settings (INT_M1 and INT_M2). The mask register settings only influence the interrupt output condition.

The interrupt output goes inactive during the read of INT_S1 or INT_S2. If interrupts occur during this read the interrupt line goes active immediately after the read is finished. So processors with level or transition triggered interrupt inputs can be connected.

Name	Addr.	Bits	r/w	Function
STATUS	70h	0	r	always '0'
		1	r	processing/non processing status
				'1' the HFC-S PCI is in processing phase (every 125µs)
				'0' the HFC-S PCI is not in processing phase
		2	r	processing/non processing transition interrupt status
				'1' The HFC-S PCI has finished internal processing phase
				(every 125µs)
		3	r	always '0'
		4	r	timer status
				'0' timer not elapsed
				'1' timer elapsed
		5	r	TE/NT state machine interrupt state
				'1' state of state machine has changed
		6	r	FRAME interrupt has occured (any data channel interrupt)
				all masked D-channel and B-channel interrupts are "ored"
		7	r	ANY interrupt
				all masked interrupts are "ored"

Reading the STATUS register clears no bit.

^{*)} with 33 MHz PCI clock

7 S/T interface circuitry

In order to comply to the physical requirements of ITU-T recommendation I.430 and considering the national requirements concerning overvoltage protection and electromagnetic compatibility (EMC), the HFC-S PCI needs some additional circuitry, which are shown in the following figures.

7.1 External receiver circuitry

Figure 9: External receiver circuitry

Part list

VDD	5V	3.3V	C1	47 nF
		J.J 1	C3, C3'	
R1, R1'	33 kΩ		·	22pF
R2, R2'	$100 \text{ k}\Omega$		D1, D2	1N4148 or LL4148
R3	$1~\mathrm{M}\Omega$	680 k Ω	D3, D4	1N4148 or LL4148
R4	$3.9~\mathrm{k}\Omega$		S/T module	see Table 3 on page 52.
R5, R5'	$4.7~\mathrm{k}\Omega$			
R6, R6'	$4.7~\mathrm{k}\Omega$			
R7	$1.8~\mathrm{M}\Omega$	$1.2M\Omega$		

C3, C3' are for reduction of high frequency input noise and should be located as close as possible to the HFC-S PCI.

February 1999 49 of 64

7.2 External transmitter circuitry

Figure 10: External transmitter circuitry

Part List

VDD	5 V	3.3V	C3	470 pF
R1	$2.2 \text{ k}\Omega \pm 1\%$	$560 \Omega \pm 1\%$	D2, D3	1N4148 or LL4148
R2	$3.0 \text{ k}\Omega \pm 1\%$	$3.9 \text{ k}\Omega \pm 1\%$	D4, D5	1N4148 or LL4148
R3, R3' *)	18Ω	18 Ω	ZD1	Z-Diode 2.7 V
R4	100Ω	50 Ω		(e. g. BZV 55C 2V7)
R5	$5.6~\mathrm{k}\Omega$	3.3 kΩ	T1, T1'	BC550C, BC850C or similar

Table 3: S/T module part numbers and manufacturer

7.3 Oscillator circuitry

Figure 11: Oscillator Circuitry

Part list:

Q1 12.288 MHz quartz

R1 $0..50 \Omega$

R2 $1 M\Omega$

C1, C2 47 pF

The values of C1, C2 and R1 depend on the used quartz.

For a load-free check of the oscillator frequency the C4O clock of the GCI/IOM2 bus should be measured (HFC-S PCI as master, S/T interface deactivated, 4.096 MHz frequency intented on the C4IO).

7.4 EEPROM circuitry

Figure 12: EEPROM circuitry

February 1999 53 of 64

7.5 PME pin circuitry

The PME pin (pin 53) on the HFC-S PCI is high active. To connect it to the low active PME# pin on the PCI bus, the following circuitry is neccessary.

Figure 13: PME pin circuitry

8 State matrices for NT and TE

8.1 S/T interface activation/deactivation layer 1 for finite state matrix for NT

State name	Reset	Deactive	Pending activation	Active	Pending deactivation
State number	G0	G1	G2	G3	G4
Event INFO sent	INFO 0	INFO 0	INFO 2	INFO 4	INFO 0

Receiving INFO 0	1	1		G2	G1
Receiving INFO 1	1	G2 (Note 1)		/	1
Receiving INFO 3	_	/	G3 (Note 1)	_	_
Lost framing	_	/	1	G2	

Table 4: Activation/deactivation layer 1 for finite state matrix for NT

— No state change

/ Impossible by the definition of peer-to-peer physical layer procedures or system internal reasons
Impossible by the definition of the physical layer service

Note 1: Timer 1 (T1) is not implemented in the HFC-S PCI and must be implemented in software.

Note 2: Timer 2 (T2) prevents unintentional reactivation. Its value is 32ms ($256 \times 125\mu s$). This implies that a TE has to recognize INFO 0 and to react on it within this time.

Note 3: After reset the state machine is fixed to G0.

February 1999 55 of 64

Table 5: Activation/deactivation layer 1 for finite state matrix for TE

- No change, no action
- Impossible by the definition of the layer 1 service
- / Impossible situation

Notes

- Note 1: After reset the state machine is fixed to F0.
- Note 2: This event reflects the case where a signal is received and the TE has not (yet) determined wether it is INFO 2 or INFO 4.
- Note 3: Bit- and frame-synchronisation achieved.
- Note 4: Loss of Bit- or frame-synchronisation.
- Note 5: Timer 3 (T3) is not implemented in the HFC-S PCI and must be implemented in software.

9 Binary organisation of the frames

9.1 S/T frame structure

The frame structures are different for each direction of transmission. Both structures are illustrated in Figure 14.

Figure 14: Frame structure at reference point S and T

F	Framing bit	N	Bit set to a binary value $N = \overline{F}_A$ (NT to TE)
L	D.C. balancing bit	B1	Bit within B-channel 1
D	D-channel bit	B2	Bit within B-channel 2
E	D-echo-channel bit	A	Bit used for activation
F_A	Auxiliary framing bit	S	S-channel bit
M	Multiframing bit		

d note!

Lines demarcate those parts of the frame that are independently d.c.-balanced.

The F_A bit in the direction TE to NT is used as Q bit in every fifth frame if S/Q bit transmission is enabled (see SCTRL register).

The nominal 2-bit offset is as seen from the TE. The offset can be adjusted with the CLKDEL register in TE mode. The corresponding offset at the NT may be greater due to delay in the interface cable and varies by configuration.

HDLC-B-channel data start with the LSB, PCM-B-channel data start with the MSB.

February 1999 57 of 64

9.2 GCI frame structure

The binary organistation of a single GCI channel frame is described below.

Figure 15: Single channel GCI format

- B1 B-channel 1 data
- B2 B-channel 2 data
- M Monitor channel data
- D D-channel data
- C/I Command/indication bits for controlling activation/deactivation and for additional control
 - functions
- MR Handshake bit for monitor channel
- MX Handshake bit for monitor channel

10 Clock synchronisation

10.1 Clock synchronisation in NT-mode

Figure 16: Clock synchronisation in NT-mode

February 1999 59 of 64

10.2 Clock synchronisation in TE-mode

Figure 17: Clock synchronisation in TE-mode

The C4IO clock is adjusted in the 31th time slot at the GCI/IOM bus twice for one half clock cycle. This can be reduced to one adjustment of a half clock cycle. This is useful if another HFC-S, HFC-S+, HFC-SP or HFC-S PCI is connected as slave in NT mode to the GCI/IOM2 bus.

11 HFC-S PCI package dimensions

Figure 18: HFC-S PCI package dimensions

February 1999 61 of 64

12 ISDN PCI card sample circuitry with HFC-S PCI

The 8-Bit-Flip-Flop (U3) is only needed for auxiliary port accesses. The EEPROM (U2) is also optional.
