

#### **OVERVIEW**

The SM1350AAQM is single-chip high tone quality melody IC, fabricated using NPC's Molybdenum-gate CMOS process. Melodies are selected in serial or binary (parallel) mode, 6 programmable melodies are stored, and the high tone quality melody is output by how to specify the user. It is making this IC ideal for mechanical clocks and similar applications where high tone quality output is demanded.

#### **FEATURES**

- Basic Functions
- 4.0MHz oscillator frequency
- Power-save function
- Oscillator stopped when no output
- S0 to S3, MODE, LH pull-up resistors open
- · A-class output
- Chattering prevention circuit (STN, STOP, S0 to S3)
- 10-bit D/A converter current-summing
- Sound Generator Functions
- DWS (dual wave synthesis) sound generators
- 4 simultaneous sounds for 4 tones
- Melody Functions
- 6 programmable melodies
- Level hold/one-shot melody modes
- Serial/binary (parallel) select modes
- Control Signal Outputs
- BUSYN signal : LOW during melody output
- CT signal : pulse output synchronizing with selected notes or rests
- 2.4 to 5.5V supply voltage
- Molybdenum-gate CMOS
- Package: 24-pin SSOP

#### ORDERING INFOMATION

Device	Package
SM1350AAQM	24 pin SSOP

# **BLOCK DIAGRAM**

# **PIN DESCRIPTION**

No.	Pin Name	I/O	State*1	Description						
1	VDD	-	-	Supply pin						
2	S0									
3	S1		SU	Binary select mode : Phrase select pins.						
4	S2	I	SU	Serial select mode: S0 and S1 control melody output.						
5	S3									
6	MODE	I	SU	Melody select mode control. Binary mode when LOW, and serial mode when HIGH.						
7	LH	I	SU	Melody output mode control. One-shot when LOW, and level hold when HIGH.						
8	STOP	I	U	One-shot melody mode : Melody output stop control.  Level hold melody mode : invalid input.						
9	STN	I	U	Melody start control						
10	BUSYN	О	С	Busy output signal. LOW when a melody is output.						
11	CT	О	С	External control pulse output						
12	ICN	I	U	Initialization clear input						
13	VSS	-	-	Ground pin						
14	VOL	I	-	Volume adjusts control. Volume adjusted using an external resistor.						
15	SPN	O	P	VOL current output						
16	SP	O	P	10-bit D/A converter output						
17	EBUSYIN	I	U	It is not necessary to use it usually. It should connect VDD or OPEN. When this terminal is made LOW, BUSYN compulsorily becomes LOW. A pop sound might be emitted.						
18	ENDN	О	С	Pulse signal when melody output ends						
19	T1N	I	U	Test signal inputs						
20	T2N	I	U	Test signal inputs This terminal cannot be used. It should connect VDD or OPEN.						
21	T3N	I	U	This terminal cannot be used. It should connect VDD of OPEN.						
22	TO	0	С	Test signal output. 62.5kHz output when not in test mode.						
23	XTN	0	-	Oscillator output						
24	XT	I	-	Oscillator input						

<sup>\*1.</sup> U : pull-up resistor connection

(Function for current consumption decrease when driving with battery. Only when the terminal is read, the pull-up resistor is connected.)

P : p-channel open drain C : complementary output

SU: pull-up resistor connection only when melody output starts

# **SPECIFICATIONS**

# **Absolute Maximum Ratings**

 $V_{SS}=0V$ 

Parameter	Symbol	Rating	Unit
Supply voltage	$V_{ m DD}$	-0.3 to 7.0	V
Input voltage*1	$V_{IN}$	-0.3 to V <sub>DD</sub> +0.3	V

<sup>\*1.</sup> These are ratings when clock signals are input from the outside to XT pin.

Note. Input signal should be risen or fallen to the following time or less.

<sup>\*2.</sup> The time taken for fast damping to reduce the envelope to 0 level.

### **FUNCTIONAL DESCRIPTION**

### **Chattering Prevention**

### STN, STOP chattering prevention function

### (a) Oscillator stopping (Standby Mode)

The oscillator starts when STN goes from HIGH to LOW in standby mode. Input data is received and melody data output starts 81.9ms after the oscillator start if STN is LOW. SM1350 dose not operate even if the signal is input to STOP in standby mode.

Figure 1. STN,STOP chattering prevention timing (oscillator stopping)

### (b) Oscillator running

Input data is considered valid 81.9ms after STN and STOP have last changed state. Input data is considered invalid for intervals less than 65.5ms.

Figure 2. STN,STOP chattering prevention timing (oscillator running)

#### S0 to S3 chattering prevention function

In binary select mode, S0 to S3 are sampled in sync with the 15.26Hz clock during level-hold melody output. The chatter prevention function compares the data sampled 65.5ms after a data transition on S0 to S3 with the data sampled 65.5ms before the data transition. If the 2 data samples are the same, then the data transition is considered invalid. However, if they are not the same indicating a true transition has occurred, melody output stops and only restarts again after 2 consecutive identical melody select data samples occur. Note that except for binary select mode with level hold output, the S0 to S3 chattering prevention circuit is disabled.

Figure 3. S0~S3 chattering prevention timing

#### Initialization

When power on and ICN goes LOW, all pins and internal states are initialized to the states shown below. It is recommended to initialize before melody output for steady operation.

- Output pins
  - $\begin{array}{lll} \bullet \mbox{ SP, SPN} & : \mbox{ Open} \\ \bullet \mbox{ ENDN} & : \mbox{ V}_{\mbox{DD}} \\ \bullet \mbox{ CT} & : \mbox{ V}_{\mbox{SS}} \\ \bullet \mbox{ BUSYN} & : \mbox{ V}_{\mbox{DD}} \\ \end{array}$
- Serial melody counter

Reset to first melody (S0 to S3 all 0)

Oscillator circuitStopped

### **Melody Output Circuit**

The volume control circuit comprises a P-channel current-summing D/A converter, a built-in constant-current source and an external variable resistor.

### **Output circuit (A-class)**

The A-class output circuit comprises a single 10-bit D/A converter with current output on SP. The D/A converter is set ON immediately after the oscillator starts, and the current output that results is the center point above and below which the converter current output varies in response to the waveform amplitude. The SP output is current-to-voltage converted for connection to audio equipment or amplifiers. The 4 sound generator waveforms are time multiplexed, so an integrating circuit must be connected between SP and the amplifier to recover the signal.

# **Pin Functions**

#### STN pin

Melody start signal. Melody starts when LOW is detected.

### One-shot melody output (LH=LOW)

One-shot melody is a melody control that stops melody after it play to the last of the melody when there is a start trigger. When STN goes LOW during melody output, the melody specified with S0 to S3 is played

Figure 5. One-shot mode

#### One-shot mode repeat function

In one-shot melody mode, the output repeats the same melody while STN is LOW. When STN goes HIGH, the output continues until the end of the currently playing melody and then stops.

Figure 6. One-shot melody repeat timing

#### Level hold melody output (LH=HIGH)

Level hold melody output is played when STN is LOW, and it goes HIGH, it is melody control which stops in the middle of melody. When either of S0 to S3 changes during melody output, it restarts from the head of the melody newly selected.

\* This function is effective only while the level hold melody output in the binary select mode.

Figure 7. Level hold mode

### Binary select mode (MODE=LOW)

A melody of 1 to 6 is selected according to the condition (0000 to 1111) of S0 to S3.

### Serial select mode (MODE=HIGH)

In serial select mode, the next melody is selected by cycling through the melodies in the order  $\#N \to \#N + 1...\#N-1 \to \#N$  when the STN input goes LOW. Note that when melody output is stopped using the STOP input, the melody-select counter increments.

### One-shot melody output (LH=LOW)

Figure 8. One-shot mode (serial select)

### Level hold melody output (LH=HIGH)

Figure 9. Level hold mode (serial select)

The melody selection in serial mode is controlled by S0 and S1 as shown in the following table. The states of S0 and S1 are read in immediately after startup and the change of S0 and S1 during melody output is invalid.

S1	S0	Melody counter				
LOW	LOW - Increments when melody output ste					
HIGH	LOW	No increment				
HIGH	HIGH	Increments when melody output starts				

Stable 1. S0, S1 resistor and melody counter

Figure 10. S0, S1 melody output control timing

#### STOP pin

One-shot output mode stops when STOP goes from HIGH to LOW. The STOP input is ignored in level hold output mode and is also ignored in one-shot mode when STN is LOW. Note that even when STOP is LOW, STN has higher priority.

#### CT pin

A pulse in sync with selected notes or rests is output on CT. 16.4ms pulse is output when a note or rest occurs for which the corresponding CT data in score ROM is set to 1.

Figure 11. CT pulse mode output

#### **Fast Damping**

When melody output stops, the D/A converter output amplitude dose not fall to zero instantaneously, instead the output converges to zero within a maximum of 8.2ms to prevent noise being generated. Also, when one-shot melody output mode is retriggered, melody output restarts after the fast damping interval. When melody out is stopped by ICN input, it instantaneously becomes 0 level.

Please pay your attention to the following points at time of using the products shown in this document.

- 1. The products shown in this document (hereinafter "Products") are designed and manufactured to the generally accepted standards of reliability as expected for use in general electronic and electrical equipment, such as personal equipment, machine tools and measurement equipment. The Products are not designed and manufactured to be used in any other special equipment requiring extremely high level of reliability and safety, such as aerospace equipment, nuclear power control equipment, medical equipment, transportation equipment, disaster prevention equipment, security equipment. The Products are not designed and manufactured to be used for the apparatus that exerts harmful influence on the human lives due to the defects, failure or malfunction of the Products. If you wish to use the Products in that apparatus, please contact our sales section in advance.
  In the event that the Products are used in such apparatus without our prior approval, we assume no responsibility whatsoever for any
  - In the event that the Products are used in such apparatus without our prior approval, we assume no responsibility whatsoever for any damages resulting from the use of that apparatus.
- 2. NPC reserves the right to change the specifications of the Products in order to improve the characteristics or reliability thereof.
- 3. The information described in this document is presented only as a guide for using the Products. No responsibility is assumed by us for any infringements of patents or other rights of the third parties which may result from its use. No license is granted by implication or otherwise under any patents or other rights of the third parties. Then, we assume no responsibility whatsoever for any damages resulting from that infringements.
- 4. The constant of each circuit shown in this document is described as an example, and it is not guaranteed about its value of the mass production products.
- 5. In the case of that the Products in this document falls under the foreign exchange and foreign trade control law or other applicable laws and regulations, approval of the export to be based on those laws and regulations are necessary. Customers are requested appropriately take steps to obtain required permissions or approvals from appropriate government agencies.
