
Single chip 2.4 GHz Transmitter
nRF2402

FEATURES

- True single chip GFSK transmitter in a small 16-pin package (QFN16 4x4)
- Adjustable output power up to 0dBm
- Data rate 0 to 1Mbps
- Low Bill of Material
- Multi Channel operation
 - 128 channels
 - Support frequency hopping
 - Channel switching time <200µs.
- Power supply range: 1.9 to 3.6 V
- CRC computation
- ShockBurst™ mode for ultra-low power operation
- Low supply current, typical 10mA peak @ -5dBm output power
- 100% RF tested
- World wide use

APPLICATIONS

- Wireless mouse, keyboard, joystick
- Keyless entry
- Wireless data communication
- Alarm and security systems
- Home Automation
- Remote control
- Surveillance
- Automotive
- Telemetry
- Intelligent sports equipment
- Industrial sensors
- Toys

GENERAL DESCRIPTION

nRF2402 is a single-chip radio transmitter for the world wide 2.4 - 2.5 GHz ISM band. The transmitter consists of a fully integrated frequency synthesizer, a power amplifier, a crystal oscillator and a modulator. Output power and frequency channel is easily programmable by use of the 3-wire interface. Current consumption is very low, only 10 mA at an output power of -5dBm. Built-in ShockBurst™ and Power Down modes make power saving easily realizable.

QUICK REFERENCE DATA

Parameter	Value	Unit
Minimum supply voltage	1.9	V
Maximum output power	0	dBm
Maximum GFSK data rate	1000	kbps
Supply current GFSK transmitter @ -5dBm output power	10	mA
Supply current in Power Down mode	200	nA

I _{VDD}	Average Supply current @ -5dBm output power, ShockBurst™	6)		500		μA
I _{VDD}	Supply current in stand-by mode			12		μA
I _{VDD}	Supply current in power down			200		nA

NOTES:

- 1) Usable band is determined by local regulations
- 2) The crystal frequency may be chosen from 5 different values (4, 8, 12, 16, and 20MHz) which are specified in the configuration word, see Table 7. 16MHz is required for 1Mbps operation.
- 3) Data rate must be either 250kbps or 1000kbps.
- 4) Antenna load impedance = 100Ω+j175Ω
- 5) Antenna load impedance = 100Ω+j175Ω. Effective data rate 250kbps or 1Mbps.
- 6) Antenna load impedance = 100Ω+j175Ω. Effective data rate 10kbps.

Table 3 nRF2402 electrical specifications

PACKAGE OUTLINE

nRF2402G, uses the QFN16 4x4 package, with matt tin plating. The nRF2402 complies with the EU directives WEEE (Waste Electrical and Electronic Equipment), and RoHS (Restriction of use of Certain Hazardous Substances) and also the “green partner” program of SONY, SS-00259.

Package Type		A	A1	A3	K	D/E	e	D2/E2	L	b

MODES OF OPERATION

Overview of Operational Modes

The nRF2402 can be set in the following main modes depending on three control pins:

Mode	PWR_UP	CE	CS
Active	1	1	0
Configuration	1	0	1
Stand By	1	0	0
Power Down	0	X	X

Table 5 Overview of Operational Modes of nRF2402.

Active Modes

The nRF2402 has two transmit modes:

- ShockBurst™
- Direct Mode

The device functionality in these modes is determined by the content of a configuration word. This configuration word is presented in the configuration section.

ShockBurst™

The ShockBurst™ technology uses on-chip FIFO to clock in data at a low data rate and transmit at a very high rate thus enabling extreme reduction in power consumption.

When operating the nRF2402 (in co-operation with nRF2401/nRF24E1) in ShockBurst™, you gain access to the high data rates (1 Mbps) offered by the 2.4 GHz band without the need of a costly, high-speed micro controller (MCU) for data processing.

By putting all high speed signal processing related to RF protocol on-chip, the nRF2402 offers the following benefits:

- Highly reduced current consumption
- Lower system cost (facilitates use of less expensive micro controller)
- Greatly reduced risk of 'on-air' collisions due to short transmission time

The nRF2402 can be programmed using a simple 3-wire interface where the data rate is decided by the speed of the micro controller.

By allowing the digital part of the application to run at low speed while maximizing the data rate on the RF link, the nRF ShockBurst™ mode reduces the average current consumption in applications considerably.

ShockBurst™ principle

When the nRF2402 is configured in ShockBurst™, TX operation is conducted in the following way (10 kbps for this example only).

Figure 4 Clocking in data with MCU and sending with ShockBurst™ technology

Figure 5 Current consumption with and without ShockBurst™ technology

nRF2402 ShockBurst™ Transmit:

MCU interface pins: CE, CLK, DIN

1. When the application MCU has data to send, set CE high. This activates RF2402 on-board data processing.
2. The address of the receiving node (RX address) and payload data is clocked into the nRF2402. The application protocol or MCU sets the speed (ex: 10kbps).
3. MCU sets CE low, this activates a nRF2402 ShockBurst™ transmission.
4. nRF2402 ShockBurst™:
 - RF front end is powered up
 - RF package is completed (preamble added, CRC calculated)
 - Data is transmitted at high speed (250 kbps or 1 Mbps configured by user).
 - nRF2402 returns to stand-by when finished

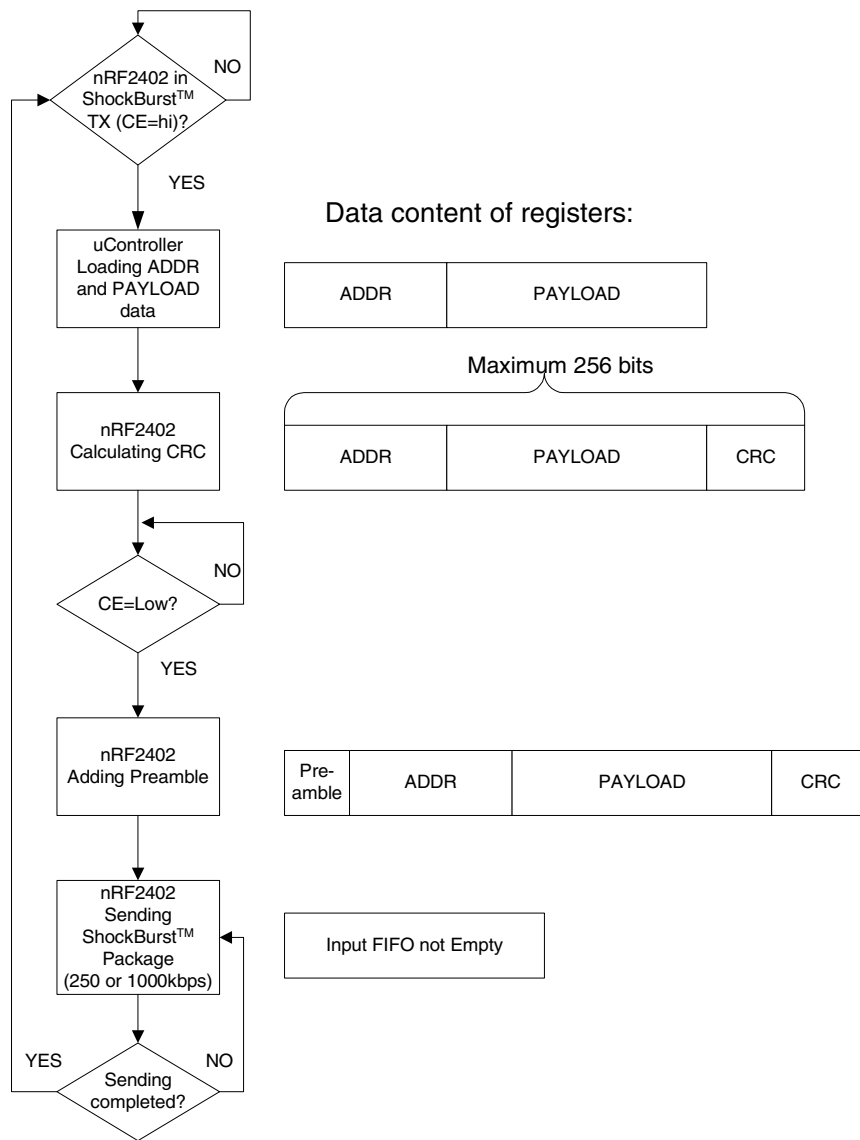

Figure 6 Flow Chart ShockBurst™ Transmit of nRF2402 with CRC and preamble.

Direct Mode

In direct mode the nRF2402 works like a traditional RF device. The data rate must be 1Mbps \pm 200ppm, or 250kbps \pm 200ppm at low data rate setting, for the receiver (nRF2401A/nRF24E1) to detect the signals.

MCU interface pins: CE, DIN

1. When application MCU has data to send, set CE high
2. The nRF2402 RF front end is now immediately activated, and after 200 μ s settling time, signal on the DIN pin will modulate the carrier directly.
3. All RF protocol parts must hence be implemented in MCU firmware (preamble, address and CRC).

Configuration Mode

In configuration mode a configuration word of up to 20 bits is downloaded to nRF2402. This is done through a simple 3-wire interface (CS, CLK and DIN). For more information on configuration please refer to the nRF2402 device configuration chapter, page14.

Power Down Mode

Power down mode is used to achieve very low current consumption. Effectively the chip is disabled with minimal leakage current consumption, typically less than 200nA. Operating in this mode when not transmitting data significantly increases battery lifetime.

Stand-By Mode

Stand by mode is used to achieve low current consumption. In this mode only a part of the crystal oscillator is running (12 μ A) to guarantee a short start-up time. Operating in this mode when not transmitting data increases battery lifetime while keeping start up delays short.

Pin configuration for the different modes of nRF2402

nRF2402 MODES	INPUT PINS				
	PWR_UP	CE	CS	CLK	DIN
Power down	0	0	X	X	X
Stand by	1	0	0	X	X
Configuration	1	0	1	CLK	CONFIG DATA
TX ShockBurst™	1	1	0	CLK	TX DATA
TX Direct	1	1	0	Set to 0*	TX DATA

Table 6 Pin configuration of nRF2402.

* CLK not used in direct mode.

DEVICE CONFIGURATION

All configuration of the nRF2402 is done via a 3-wire interface to a single configuration register. The configuration word can be up to 20 bits long for ShockBurst™ use and up to 14 bits long for direct mode.

Configuration for ShockBurst™ operation

The configuration word in ShockBurst™ enables the nRF2402 to handle the RF protocol (in co-operation with nRF2401A/nRF24E1). Once the protocol is completed and loaded into nRF2402 only seven bits, also used in direct mode, needs to be updated during operation.

The configuration bits dedicated to ShockBurst™ is as follows:

- Preamble: Generation of 8 bit preamble in transmitted data.
- CRC: Enables nRF2402 on-chip CRC generation.

NOTE:

The MCU must generate an address and a payload section that fits the configuration of the nRF2401A/nRF24E1 that is to receive the data.

When using the nRF2402 on-chip CRC feature ensure that CRC is enabled and uses the same length for both the nRF2402 and the receiving nRF2401A/nRF24E1 devices.

PRE-AMBLE	ADDRESS	PAYLOAD	CRC
-----------	---------	---------	-----

Figure 7 Data packet set-up

Configuration for Direct Mode operation

For direct mode operation only the 14 first bits (bit[13:0]) of the configuring word is relevant.

Configuration Word overview

	Bit position	Number of bits	Name	Function
General device configuration	19	6	PLL Control	Close the PLL for test.
	18	1		UNUSED
	17	1	PREAMBLE	Enable on-chip PREAMBLE generation
	16	1	PREAMBLE	UNUSED, must be 1
	15	1	CRC	8 or 16 bit CRC
	14	1	CRC	Enable on-chip CRC generation
	13	1	CM	Communication mode (Direct or ShockBurst™)
	12	1	RFDR_SB	RF data rate (1Mbps requires 16MHz crystal)
	11:9	3	XO_F	Crystal frequency
	8:7	2	RF_PWR	RF output power
6:0	7	RF_CH#	Frequency channel (0 to 127)	

Table 7 Table of configuration words.

The configuration word is shifted in MSB first on positive CLK edges. New configuration is enabled on the negative edge of CS.

NOTE!

On the negative edge of CS, the nRF2402 updates the number of bits actually shifted in during the last configuration.

Ex:

If the nRF2402 is to be configured for Preamble and CRC in ShockBurst™, a total of 17 bits must be shifted in during the first configuration after VDD is applied.

Once the wanted "protocol" and modus are set there is no need to update this part of the configuration during operation. If RF channel is to be changed, only the RF_CH# bits need to be updated.

Configuration Word Detailed Description

The following describes the function of the 32 bits (bit 31 = MSB) that is used to configure the nRF2402.

General Device Configuration: bit[13:0]

ShockBurst™ Configuration: bit[17:14]

Test Configuration: bit[19:18]

TEST		ShockBurst				Default
D19	D18	D17	D16	D15	D14	
PLL		PRE_EN		CRC		
0	0	1	1	0	0	

RF-Programming														LSB
D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	Default
Burst	OD	XO Frequency			RF Power		Channel selection							
0	0	1	1	1	1	0	0	0	0	0	0	1	0	

The MSB bit should be loaded first into the configuration register.

Default configuration word: h30F02.

Test configuration

Bit 19:

PLL: For test purposes the PLL may be closed to send a constant carrier

Logic 0: Open loop (normal operation)

Logic 1: Closed loop (test only)

Bit 18:

Not used, must be set to logic 1

ShockBurst™ configuration

The section bit[17:14] contains the segments of the configuration register dedicated to ShockBurst™ operation. After VDD is turned on ShockBurst™ configuration must be done once, but remains set whilst VDD is present. During operation only the 7 bits for frequency channel normally need to be changed.

PREAMBLE		CRC	
17	16	15	14

Table 8 Preamble and CRC settings.

Bit 17:

PRE_EN: Preamble to be generated by nRF2402 in ShockBurst™.
 Logic 0: No generation of Preamble
 Logic 1: Preamble generation enabled (default)

Bit 16:

Not used, must be set to logic 1

Bit 15:

CRC_L: CRC length to be calculated by nRF2402 in ShockBurst™.
 Logic 0: 8 bit CRC (default)
 Logic 1: 16 bit CRC

Bit 14:

CRC_EN: Enables on-chip CRC generation (TX)
 Logic 0: On-chip CRC generation disabled (default)
 Logic 1: On-chip CRC generation enabled

NOTE:

An 8 bit CRC (compared to 16 bit) will increase the number of payload bits possible in each ShockBurst™ data packet, but will also reduce the communication integrity.

General device configuration:

This section of the configuration word handles RF and device related parameters.

Burst	OD	XO_F			RF_PWR	
13	12	11	10	9	8	7

Table 9 RF operational settings.

Bit 13:

Burst: Logic 0: nRF2402 operates in direct mode (default)
 Logic 1: nRF2402 operates in ShockBurst™ mode

Bit 12:

OD:

Logic 0: 250 kbps data rate
 Logic 1: 1 Mbps data rate

NOTE:

1Mbps requires 16MHz crystal.

Bit 11-9:

XO_F: Selects the nRF2402 crystal frequency to be used:

XO FREQUENCY SELECTION			
D11	D10	D9	Crystal Frequency [MHz]
0	0	0	4
0	0	1	8
0	1	0	12
0	1	1	16
1	0	0	20

Table 10 Crystal frequency setting.

Bit 8-7:

RF_PWR: Sets nRF2402 RF output power:

RF OUTPUT POWER		
D8	D7	P [dBm]
0	0	-20
0	1	-10
1	0	-5
1	1	0

Table 11 RF output power setting.

Conditions: Load impedance = 100+j175 Ω.

RF channel

RF_CH#						
6	5	4	3	2	1	0

Table 12 Frequency channel setting.

Bit 6 – 0:

RF_CH#: Sets the frequency channel the nRF2402 transmits in.

The channel frequency is given by:

$$Channel_{RF} = 2400 \text{ MHz} + RF_CH\# \cdot 1.0 \text{ MHz}$$

RF_CH #: Frequencies between 2400MHz and 2527MHz may be set.

DATA PACKAGE DESCRIPTION

Figure 8 Data Package Diagram

The data packet for both ShockBurst™ mode and direct mode communication is divided into 4 sections. These are:

1. PREAMBLE	<ul style="list-style-type: none"> The preamble field is a requirement for ShockBurst™ and Direct modes Preamble is 8 bits in length and is dependent on the 1st data bit. <table style="margin-left: 20px;"> <tr> <td>PREAMBLE</td> <td>1st Data Bit (Address)</td> </tr> <tr> <td>01010101</td> <td>0</td> </tr> <tr> <td>10101010</td> <td>1</td> </tr> </table> Preamble is automatically added to the data packet and thereby gives extra space for payload in ShockBurst™. Preamble must be added by MCU in Direct mode 	PREAMBLE	1 st Data Bit (Address)	01010101	0	10101010	1
PREAMBLE	1 st Data Bit (Address)						
01010101	0						
10101010	1						
2 ADDRESS	<ul style="list-style-type: none"> The address field is required in ShockBurst™ mode.¹ 8 to 40 bits length. Address automatically removed from received packet in ShockBurst™ mode. In Direct mode MCU must handle address. 						
3 PAYLOAD	<ul style="list-style-type: none"> The data to be transmitted In ShockBurst™ mode payload size is 256 bits minus the following: (Address: 8 to 40 bits. + CRC 8 or 16 bits). In Direct mode the maximum payload size is defined by 1Mbps for 4ms: 4000 bits minus the following: (Preamble: 8 bits. + Address: 0 to 40 bits. + CRC: 0, 8 or 16 bits). 						
4 CRC	<ul style="list-style-type: none"> On chip CRC calculation is an option in ShockBurst™ mode, and is not used in Direct mode. 8 or 16 bits length 						

Table 13 Data package

¹ Suggestions for the use of addresses in ShockBurst™: In general more bits in the address gives less false detection, which in the end may give lower data packet loss.

- The address made by (5, 4, 3, or 2) equal bytes are not recommended because it in general will make the packet-error-rate increase.
- Addresses where the level shift only one time (i.e. 000FFFFFFF) could often be detected in noise that may give a false detection, which again may give raised packet-error-rate.

Direct mode will be dependent on the software used in the MCU, but it is recommended to have the same restrictions on addresses for this mode.

IMPORTANT TIMING DATA

The following timing applies for operation of nRF2402.

nRF2402 Timing Data

nRF2402 timing	Min.	Max.	Name
PWR_DWN → Configuration mode		3ms	Tpd2cfgm
PWR_DWN → Active mode (TX)		3ms	Tpd2a
ST_BY → TX ShockBurst™		195µs	Tsby2txSB
ST_BY → TX Direct Mode		202µs	Tsby2txDM
Minimum delay from CS to data.	5µs		Tcs2data
Minimum delay from CE to data.	5µs		Tce2data
Delay between edges	50ns		Td
Setup time	500ns		Ts
Hold time	500ns		Th
Delay to finish internal GFSK data	1/data rate		Tfd
Minimum input clock high	500ns		Thmin
Time on air, TX Direct mode		4ms	ToaDM

Table 14 Switching times for nRF2402

When the nRF2402 is powered up it must always settle in stand by for 3ms before it can enter configuration or active mode.

Figure 9 Timing diagram for power down (or VDD off) to configuration mode for nRF2402.

Figure 10 Power down (or VDD off) to active mode

Note that the configuration word will be lost when VDD is turned off and that the device then must be configured before going to active mode. If the device is configured one can go directly from power down to active mode.

Note:

CE and CS may not be high at the same time. Setting one or the other decides whether configuration or active mode is entered.

Configuration Mode

In configuration mode the transmitters output power, transmit frequency, data rate, CRC, and preamble is set. The configuring data will be loaded during the Chip Select period (CS="1"). A random number of bits between 1 and 20 may be shifted in to the register to configure the transmitter, but normally you would at least shift in the seven channel frequency bits. The new configuration is activated on the negative edge of CS.

When one or more of the bits in the configuration word needs to be changed the following timing apply.

Configuration Mode Timing

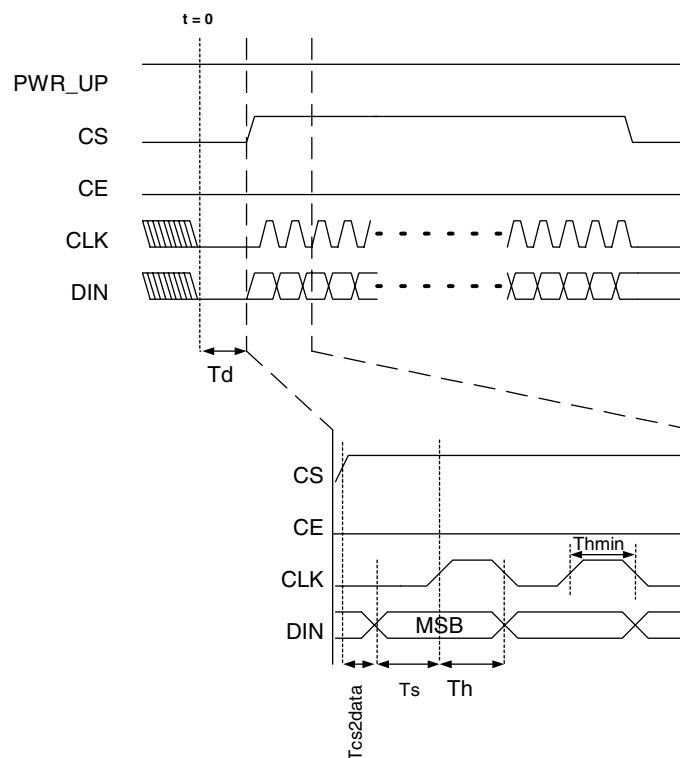

Figure 11 Timing Diagram of Configuration Mode

If configuration mode is entered from power down, CS can be set high after T_{pd2sby} as shown in Figure 9.

ShockBurst™ Mode Timing

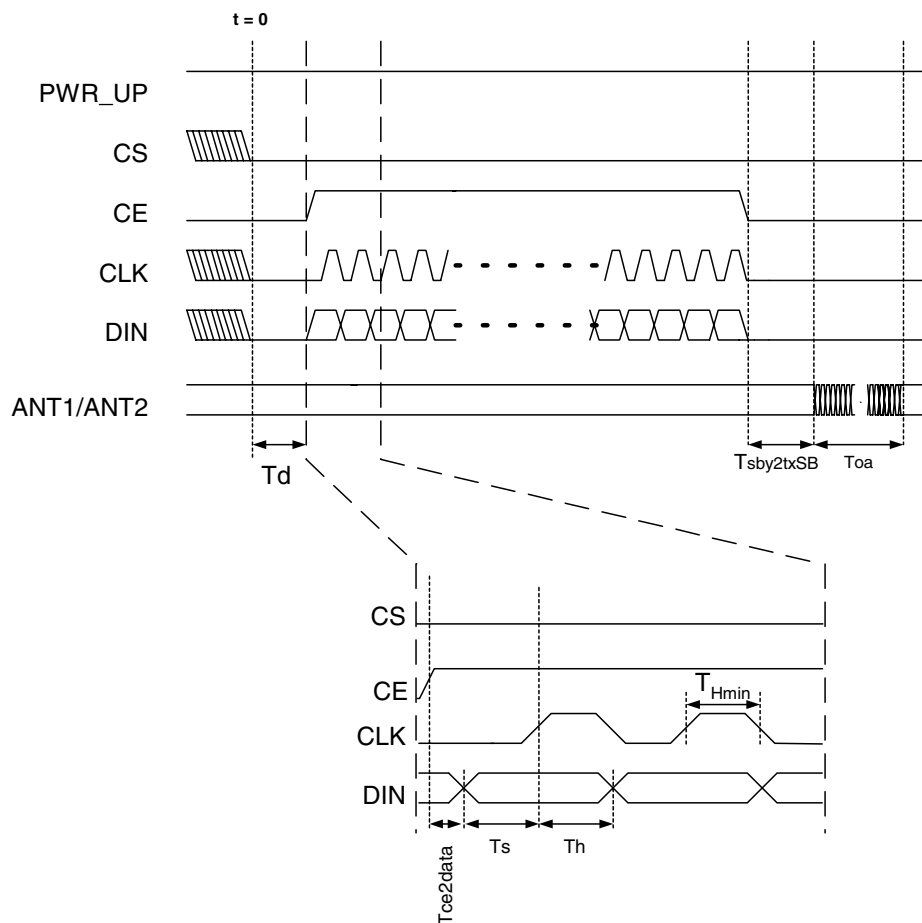

Figure 12 Timing of ShockBurst™ in nRF2402.

The package length and the data rate give the delay Toa (time on air), as shown in the equation.

$$T_{OA} = 1 / \text{datarate} \cdot (\# \text{ databits} + 1)$$

Direct Mode Timing

Figure 13 Timing Diagram of Direct Mode

In direct mode the input data will be sampled by nRF2402 and therefore no clock is needed. The clock must be stable at low level during transmission due to noise considerations. The exact delay $T_{sby2txDM}$ is given by the equation:

$$T_{sby2txDM} = 194\mu s + 1 / F_{XO} \cdot 20 + 2.25\mu s$$

The maximum length of a package (T_{oaDM}) over all voltages and temperatures is 4ms. This is limited by frequency drift in the transmitter and is independent of data rate and frequency channel.

PERIPHERAL RF INFORMATION

Antenna output

The ANT1 and ANT2 output pins provide a balanced RF output to the antenna. The pins must have a DC path to VDD_PA, either via a RF choke or via the center point in a balanced antenna. Differential load impedance between the ANT1 and ANT2 pins, $100\Omega + j175\Omega$, is recommended for maximum output power. Antennas with lower load impedance (for example 50Ω) can be matched to nRF2402 by using a simple matching network.

Antenna matching networks

The recommended 50Ω matching network is shown in Figure 14. This is a low pass network improving higher harmonic suppression.

Figure 14 Low pass antenna matching network

A somewhat simpler matching network is shown in Figure 15.

Figure 15 High pass antenna matching network

This network utilizes one component less and uses few inductors, but performance of this network requires very careful PCB ground plane layout. The value of capacitor C_{out} is dependent on PCB ground plane layout and parasitics in the layout, and must hence be matched to a given application layout. The value of C_{out} will typically be in the range $1.0pF - 1.8pF$. C_{out} must be tuned while checking that the harmonics output is below frequency regulatory limits.

Output Power adjustment

Power setting bits of configuring word	RF output power	DC current consumption
11	0 dBm ±3dB	11.5 mA
10	-5 dBm ±3dB	10.0 mA
01	-10 dBm ±3dB	8.5 mA
00	-20 dBm ±3dB	7.0 mA

Conditions: Load impedance = 100+j175 Ω.

Table 15 RF output power setting for the nRF2402.

Crystal Specification

Tolerance includes initially accuracy and tolerance over temperature and aging.

Frequency	C _L	ESR	C _{0max}	Tolerance
4MHz	8pF – 16pF	150Ω	7.0pF	±30ppm
8MHz	8pF – 16pF	100Ω	7.0pF	±30ppm
12MHz	8pF – 16pF	100Ω	7.0pF	±30ppm
16MHz	8pF – 16pF	100Ω	7.0pF	±30ppm
20MHz	8pF – 16pF	100Ω	7.0pF	±30ppm

Table 16 Crystal specification of the nRF2402

To achieve a crystal oscillator solution with low power consumption and fast start-up time, it is recommended to specify the crystal with a low value of crystal load capacitance. Specifying a lower value of crystal parallel equivalent capacitance, Co=1.5pF is also good, but this can increase the price of the crystal itself. Typically Co=1.5pF at a crystal specified for Co_max=7.0pF.

The crystal load capacitance, C_L, is given by:

$$C_L = \frac{C_1' \cdot C_2'}{C_1' + C_2'}, \quad \text{where } C_1' = C_1 + C_{PCB1} + C_{I1} \text{ and } C_2' = C_2 + C_{PCB2} + C_{I2}$$

C₁ and C₂ are SMD capacitors as shown in the application schematics. C_{PCB1} and C_{PCB2} are the layout parasitic on the circuit board. C_{I1} and C_{I2} are the capacitance seen into the XC1 and XC2 pin respectively; the value is typical 1pF.

Sharing crystal with micro controller.

When using a micro controller to drive the crystal reference input XC1 of the nRF2402 transmitter some rules must be followed.

Crystal parameters:

When the micro controller drives the nRF2402 XC1 input, all crystal load parameters (C_L , C_0 , ESR) are set by the micro controller specification. The frequency accuracy (± 30 ppm) is still set by the nRF2402 specification. The nRF2402 will load the crystal circuitry of the micro controller by XC1 input capacitance (0.5pF) plus PBC routing parasitic.

External reference input amplitude & Current consumption

The reference input should never have signal levels exceeding rail voltages. Exceeding rail voltage will excite the ESD structure and the radio performance is degraded below specification. Applying reference sources without DC bias will bring the reference signal under GND level, and this is not acceptable.

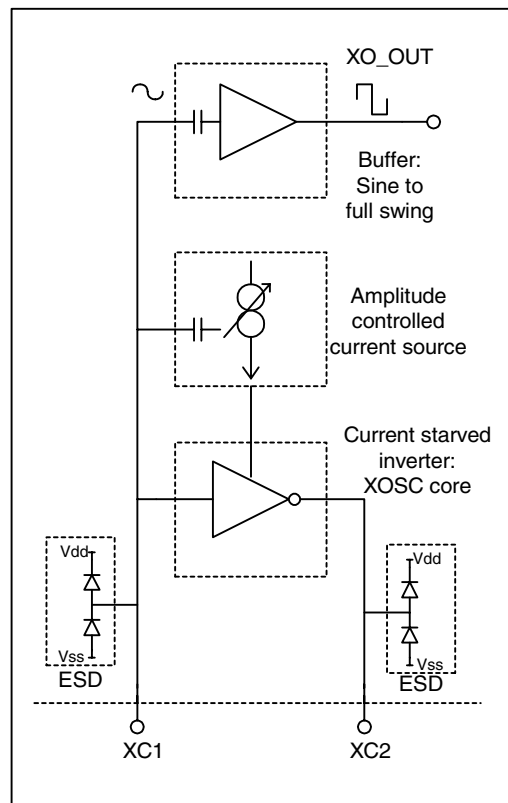

Figure 16 Principle of crystal oscillator

It is hence recommended to use a DC-block before the XC1 pin so that the internal ESD structures will self bias the XC1 voltage.

The nRF2402 crystal oscillator is amplitude regulated. To achieve low current consumption and also good signal-to-noise ratio, it is recommended to use an input signal larger than 0.4 V-peak. The needed input swing is independent of the crystal frequency. When using external crystal reference, XC2 is not used and can be left as an open pin.

Frequency Reference MCU

In direct mode there is a requirement on the accuracy of the data rate. For the receiver to detect the incoming data and recover the clock, the data rate must be within ± 200 ppm, given that the data is "random", i.e. there is a statistical calculation on how often a preamble like sequence is present in the data. The clock is synchronized for any preamble detection, be it a dedicated preamble or part of the data stream.

PCB layout and de-coupling guidelines

A well-designed PCB is necessary to achieve good RF performance. Keep in mind that a poor layout may lead to loss of performance, or even functionality, if due care is not taken. A fully qualified RF-layout for the nRF2402 and its surrounding components, including matching networks, can be downloaded from **www.nordicsemi.no**.

A PCB with a minimum of two layers including a ground plane is recommended for optimum performance. The nRF2402 DC supply voltage should be de-coupled as close as possible to the VDD pins with high performance RF capacitors, see Table 17. It is preferable to mount a large surface mount capacitor (e.g. 4.7 μ F tantalum) in parallel with the smaller value capacitors. The nRF2402 supply voltage should be filtered and routed separately from the supply voltages of any digital circuitry.

Long power supply lines on the PCB should be avoided. All device grounds, VDD connections and VDD bypass capacitors must be connected as close as possible to the nRF2402 IC. The VSS pins should be connected directly to the ground plane. One via hole should be used for each VSS pin.

Full swing digital data or control signals should not be routed close to the crystal or the power supply lines.

Reflow information

Figure 17 Soldering reflow profile, GREEN

Ramp rate (RT-150°C)	1.38 °C/s
Pre-heat (150-200°C)	134 s
Dwell @217°C	50 s
Dwell @245°C	10 s
Ramp up	1.42 °C/s
Ramp down	2.59 °C/s
Peak temperature	257 °C
Time from RT to PT	320 s

Application example

nRF2402 with single ended matching network

L3	Inductor ²⁾	0603	5.6	± 5%	nH
C7	Ceramic capacitor, 50V, NPO	0603	1.0	± 0.1 pF	pF
C8	Ceramic capacitor, 50V, NPO	0603	1.0	± 0.1 pF	pF
C9	Ceramic capacitor, 50V, NPO	0603	4.7	± 0.25 pF	pF

Table 17 Recommended components (BOM) in nRF2402 with antenna matching network

¹⁾ nRF2402 can operate at several crystal frequencies, ref. the Crystal Spec. chapter.
²⁾ Self-resonant frequency (SFR) must be > 2.7 GHz

PCB layout example

Figure 19 shows a PCB layout example for the application schematic in Figure 18.

A double-sided FR-4 board of 1.6mm thickness is used. This PCB has ground planes on both bottom layer and top layer to ensure good grounding of critical component. Additionally, there are ground areas on the component side of the board to ensure sufficient grounding of critical components. A large number of via holes connect the top layer ground areas to the bottom layer ground plane.

No components in bottom layer

DEFINITIONS

Data sheet status	
Objective product specification	This datasheet contains target specifications for product development.
Preliminary product specification	This datasheet contains preliminary data; supplementary data may be published from Nordic Semiconductor ASA later.
Product specification	This datasheet contains final product specifications. Nordic Semiconductor ASA reserves the right to make changes at any time without notice in order to improve design and supply the best possible product.
Limiting values	
Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Specifications sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.	
Application information	
Where application information is given, it is advisory and does not form part of the specification.	

Table 18. Definitions.

Nordic Semiconductor ASA reserves the right to make changes without further notice to the product to improve reliability, function or design. Nordic Semiconductor does not assume any liability arising out of the application or use of any product or circuits described herein.

LIFE SUPPORT APPLICATIONS

These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Nordic Semiconductor ASA customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Nordic Semiconductor ASA for any damages resulting from such improper use or sale.

Product Specification: Revision Date: 30.05.2006.

Datasheet order code: 300506-nRF2402.
