

# Soft Recovery Diode Types M0451YX120 to M0451YX200

The data sheet on the subsequent pages of this document is a scanned copy of existing data for this product.  
(Rating Report 83NR10 Issue 1)

This data reflects the old part number for this product which is: SM12-20CXC176.  
This part number must **NOT** be used for ordering purposes – please use the ordering particulars detailed below.

The limitations of this data are as follows:  
Only YC outline drawing (W2) in datasheet

The following links will direct you to the appropriate outline drawings  
[Outline W2](#) – 15.1mm Clamp height  
[Outline W3](#) – 26.6mm Clamp height

Where any information on the product matrix page differs from that in the following data, the product matrix must be considered correct

An electronic data sheet for this product is presently in preparation.

For further information on this product, please contact your local ASM or distributor.

Alternatively, please contact Westcode as detailed below.

Diode Type SM12-M20CXC176

Written: B.W.P. Brown

Checked: *BA*

Approved: *BWA*

The CXC176 is a high power, high voltage, fast recovery, all diffused diode based on a slice diameter of 24 mm and provides an extension of voltage range above that of the type CXC170. For use in inverters and transistor switching regulators.

This Report is applicable to higher or lower voltage grades when supply has been agreed by Sales/Production.

## 2.0 INTRODUCTION

The diode series comprises fast recovery cold-weld capsules with 24 mm all diffused silicon slices. All these diodes have controlled reverse recovery characteristics with good "S" factors. These devices will find applications as "free wheel" diodes in transistor switching circuits.

## 3.0 NOTES ON THE RATINGS

### a) Square wave ratings

These ratings are given for leading edge linear rates of rise of forward current of 100 and 200/ $\mu$ S.

### b) Energy per pulse characteristics

These curves enable rapid estimation of device dissipation to be obtained for conditions not covered by the frequency ratings.

Let:  $E_p$  be the Energy per pulse for a given current and pulse width, in joules

Then  $W_{AV} = E_p \times f$ .

### c) Junction temperature rise per pulse

Junction temperature rise at end of conduction over a single pulse is given but is only required for low duty cycle ( $\leq 1\%$ ) or single pulse operation.

$$T_{SINK} = 125 - T - E_p f R_{th}$$

where  $f$  = number of pulses per second, Hz

and  $T$  = temperature rise for single pulse, deg. C.

#### 4.0 REVERSE RECOVERY LOSS

On account of the number of circuit variables affecting reverse recovery voltage, no allowance for reverse recovery loss has been made in these ratings. The following procedure is recommended for use where it is necessary to include reverse recovery loss.

##### a) Determination by Measurement

From waveforms of recovery current obtained from a high frequency shunt (see Note 1) and reverse voltage present during recovery, an instantaneous reverse recovery loss waveform must be constructed. Let the area under this waveform be A joules per pulse. A new heat sink temperature can then be evaluated from:

$$T_{\text{SINK}} (\text{new}) = T_{\text{SINK}} (\text{original}) - A \left( \frac{r_t + .10^6}{t} + R_{\text{th}} \times f \right)$$

$$\text{where } r_t = 1.64 \times 10^{-4} \sqrt{t}$$

t = duration of reverse recovery loss per pulse in microseconds

A = Area under reverse loss waveform per pulse in joules (W.S.)

f = rated frequency at the original heat sink temperature

The total dissipation is now given by

$$W_{(\text{TOT})} = W_{(\text{original})} + A \times f$$

##### Note 1

##### REVERSE RECOVERY LOSS BY MEASUREMENT

This device has a low reverse recovered charge and peak reverse recovery current. When measuring the charge care must be taken to ensure that:

- a) a.c. coupled devices such as current transformers are not affected by prior passage of high amplitude forward current.
- b) The measuring oscilloscope has adequate dynamic range - typically 100 screen heights - to cope with the initial forward current without overload.
- c) Measurement of reverse recovery voltage waveform should be carried out with an appropriate snubber of 0.1uF and 5ohms in series connected across diode anode to cathode.

b) Design Method

In circumstances where it is not possible to measure voltage and current conditions, or for design purposes, the additional losses and transient junction temperature rise may be estimated from curves on pages 14 and 15.

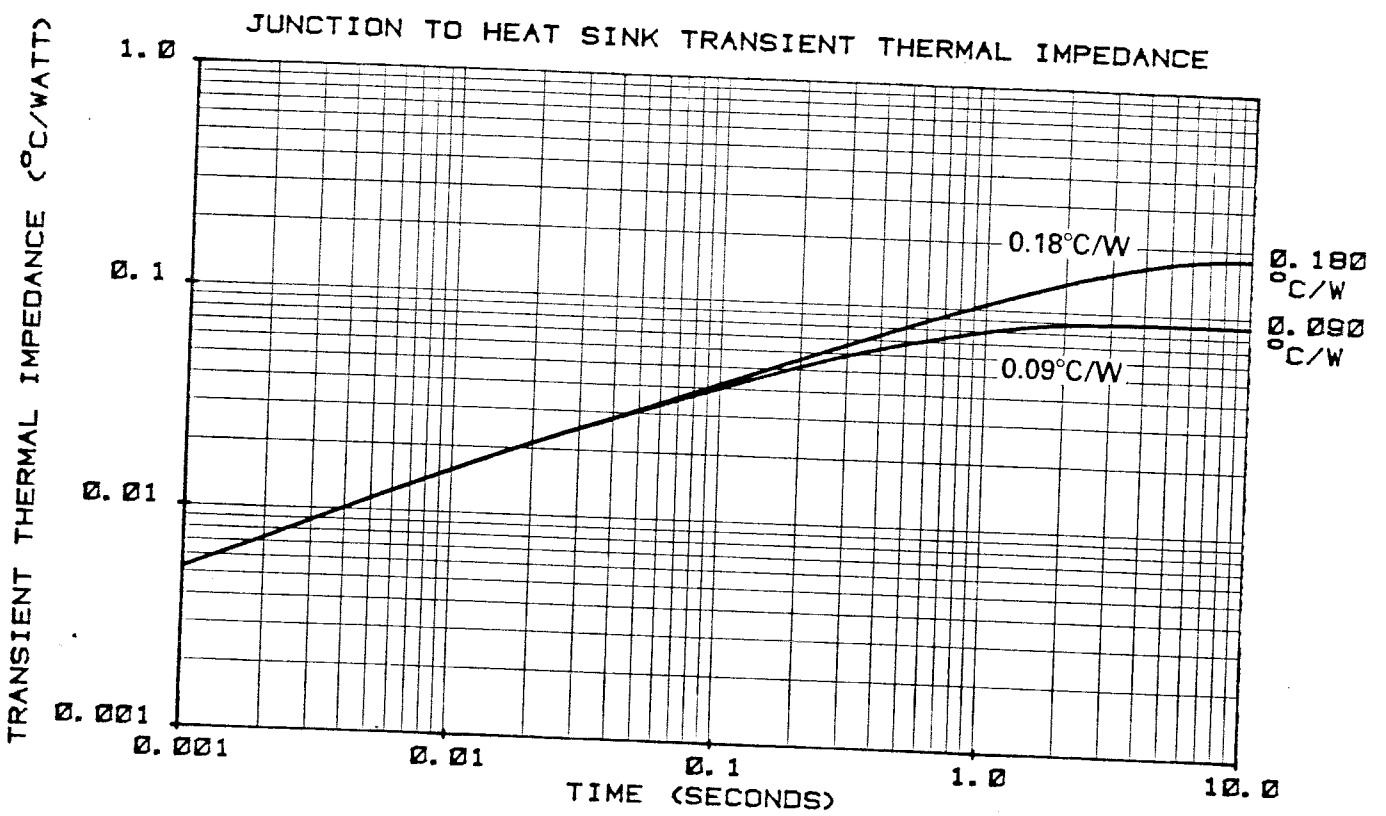

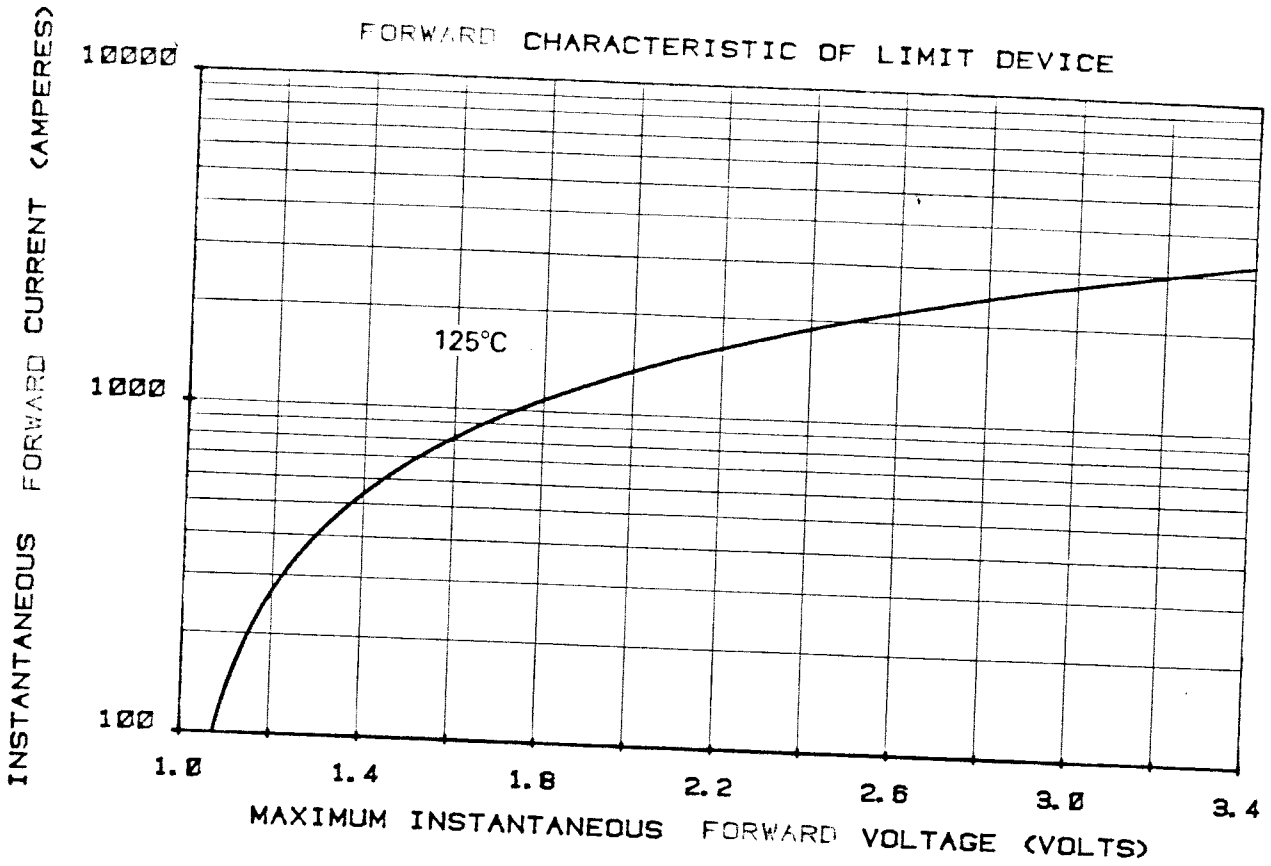

Let  $E$  be the value of energy per reverse cycle in joules (curves on p. 14)

Let  $\theta$  be the value of temperature rise per reverse recovery cycle (degrees centigrade) (curves on p. 15)

Let  $f$  be the operating frequency in Hz

Then  $T_{\text{SINK new}} = T_{\text{SINK original}} - \theta - ER_{\text{th}} f$

Where  $T_{\text{SINK new}}$  is the required maximum heat sink temperature and  $T_{\text{SINK original}}$  is the heatsink temperature given with the frequency ratings.
