Toggle (Side-Step) Dual-Channel LED Driver

**ZMDI**<sup>®</sup>

The Analog Mixed Signal Company

## Brief Description

The ZLED7002 toggle (side-step) dual-channel LED driver is one of our ZLED family of LED control ICs. It operates in the lower DC voltage supply range of 2.7V to 5.5V. This unique LED driver is capable of controlling a MAIN channel and a SUB channel. Typically, only one of the two channels is active and the ZLED7002 toggles between the channels automatically in response to the voltage supply level and the related voltage at the UV (under-voltage protection) pin. A high-to-low transition of the power supply causes the output current to switch from the MAIN channel to the SUB channel if the UV pin voltage ( $V_{UV-PIN}$ ) is below the ZLED7002's under-voltage threshold ( $V_{UVTHRSH}=1.17V$ , typical). A low-to-high transition switches the output current from the SUB channel to the MAIN channel if the UV pin voltage is 80mV (typical) above the under-voltage threshold.

The MAIN channel is a configurable constant current source driving the MAIN LED string with a maximum current draw of 250mA. The MAIN LED channel current is set by an external resistor (R3) connected to the Iset pin. Alternately, the SUB channel is activated when the ZLED7002's SUB pin is pulled to ground. Its current is determined by the forward voltage of the SUB LED and external components. The SUB channel can drive up to 100mA current through the LED channel when active.

The ZLED7002 enables voltage-level indicator applications and low-power battery-driven lighting applications that require switching to a lower-current LED channel when the supply is low, which extends the lighting life-time. Because the dropout voltage ( $V_{DP}$ ) is minimal (as low as 0.1V when the MAIN channel output current is ~200mA), the ZLED7002 is optimal for battery-powered applications. Capable of operating efficiently with DC voltage supplies ranging from 2.7V to 5.5V, it is ideal for small portable lighting applications.

The ZLED7002 can also reduce bill-of-material costs because very few external components are required for most applications, making it an optimal fit for small devices for which lighting lifetime is critical. Only four resistors, a diode, and a capacitor are needed for a typical basic application.

## Features

- Automatic MAIN channel short-circuit protection switches the output current to the SUB channel if the MAIN LED is shorted
- Under-voltage power supply detection
- Over-temperature protection

## Benefits

- Extends lighting life-time by switching to a lower-current LED channel when the supply is low
- 80mV (typical) hysteresis prevents unintended switching activation due to power supply ripple
- Ultra low quiescent current: 250 $\mu$ A typical
- Very few external components needed for operation

## Available Support

- Evaluation Kit

## Physical Characteristics

- Voltage supply: 2.7V to 5.5V DC
- Operating temperature: -25°C to 85°C
- Small SOP8 package

For additional information on our ZLED driver family, visit [www.zmdi.com/products/led-drivers/](http://www.zmdi.com/products/led-drivers/)

## 2 Circuit Description

### 2.1. ZLED7002 Overview

The ZLED7002 is an LED driver for two channels designated as the MAIN channel and the SUB channel. Typically, only one of the channels is on and the other is off. External resistors R1 and R2 connected to UV pin form a voltage divider across the power supply. When the power supply voltage has risen high enough to create a voltage at the UV pin that is above a set threshold, the MAIN LED channel is activated and the SUB channel is off. If the supply falls and the resulting voltage at the UV pin is below the threshold, the SUB channel becomes active and the MAIN channel is turned off.

When the MAIN channel is active, the ZLED7002 provides a constant current source for driving the MAIN LED channel. Its current level is set by an external resistor (R3) between the Iset and GND pins (see section 2.3). When the SUB LED channel is active, its current is determined by external components (see section 2.4) and the ZLED7002 pulls the SUB pin to ground.

Refer to the application circuit in Figure 3.1 for the location of the components referred to in the following sections.

## 2.2. Under-Voltage Threshold

The ZLED7002's UV pin enables under-voltage detection. When a high-to-low transition occurs on the power supply voltage and the voltage at the UV pin falls below the under-voltage threshold (typically 1.17V), the ZLED7002 automatically turns off the MAIN LED channel and activates the SUB channel. There is an 80mV hysteresis for the under-voltage threshold to prevent unintended activation due to power supply ripple. When a low-to-high transition occurs on the power supply voltage, the SUB channel is turned off and the MAIN channel is activated if the UV pin voltage is 80mV (typical) above the under-voltage threshold.

The voltage at the UV pin ( $V_{UV-PIN}$ ) is determined by the ratio of the external resistors R1 and R2 (see Figure 3.1), which connect to the UV pin to form a voltage divider across the power supply.  $V_{UV-PIN}$  can be calculated with equation (1):

$$V_{UV-PIN} = V_{CC} \left( \frac{R2}{R1 + R2} \right) \quad (1)$$

If the values for R1 and R2 are low, high current will flow through them resulting in lower system efficiency. Typical values for R1 and R2 are in the magnitude of  $10^5$ ; e.g., 51k $\Omega$ . For design purposes, it is helpful to select the value for R2 first and then compute R1 as needed to achieve the target ratio.

For applications using a lithium battery, which typically maintains ~3.7V during its discharge stage, setting  $V_{UV-PIN}$  to 3.4V is recommended.

## 2.3. Main LED Current

The R3 resistor connected between the Iset and GND pins determines the level of the constant current through the MAIN LED channel, which is typically 8000 times the current of the Iset pin. The voltage at the Iset pin is a constant 1.2V, which is unaffected by environmental temperature and any power supply voltage changes as shown in Figure 1.1 and Figure 1.2.

The MAIN LED current flows through the MAIN pin to ground, so voltage dropout is minimal (as low as 0.1V when the MAIN channel current is 200mA).

Note: System efficiency is reduced if the power supply voltage is larger than the MAIN LED's voltage. In this case, the additional voltage is added to the MAIN pin voltage.

The MAIN LED channel current ( $I_{MAIN}$ ) is calculated via equation (2):

$$I_{MAIN} = 8000 \left( \frac{V_{ISET}}{R3} \right) \quad (2)$$

## 2.4. Sub LED Current

The SUB LED channel current is determined by the external R4 resistor in series with the connected SUB LED string, the SUB LED forward voltage, and the voltage drop across the D1 Zener diode connected from the cathode of the SUB LED to the SUB pin. When the SUB channel is active, its current flows through the SUB pin to ground.

# ZLED7002

Toggle (Side-Step) Dual-Channel LED Driver

The Analog Mixed Signal Company

The SUB LED channel current ( $I_{SUB}$ ) is calculated via equation (3):

$$I_{SUB} = \left( \frac{V_{CC} - V_{FSUB-LED} - V_{FD1}}{R4} \right) \quad (3)$$

Where

$V_{FSUB-LED}$  = The forward voltage of the SUB LED

$V_{FD1}$  = The forward voltage of Zener diode D1, which should be as small as possible

## 2.5. ZLED7002 Protection Features

### 2.5.1. Over-Temperature Protection

The ZLED7002 includes protection from damage due to over-temperature conditions. The ZLED7002 automatically turns off if its temperature is  $\geq 160^{\circ}\text{C}$  (typical). If the temperature returns to  $\leq 140^{\circ}\text{C}$ , the ZLED7002 turns on and continues normal operation.

### 2.5.2. Main LED Short-Circuit Protection

The ZLED7002 will detect a short-circuit on the MAIN LED. In this case, the ZLED7002 automatically turns off the MAIN LED channel and activates the SUB LED channel.

## 3 Application Circuit Design

### 3.1 Applications

The ZLED7002 is designed for small battery-powered lighting life-time critical applications. Capable of operating efficiently with DC voltage supplies ranging from 2.7V to 5.5V, it is ideal for small portable lighting applications. Typical applications include helmet lighting, head/tail lights for bicycles, miner lamps, pocket lights, and various other general purpose low-voltage industrial and consumer LED applications.

**Figure 3.1 Basic ZLED7002 Application Circuit**

### 3.2 Application Circuit Layout Requirements

The following guidelines are strongly recommended when laying out application circuits:

- Use a 0.1μf capacitor connected between the UV pin and ground to minimize noise picked up on the UV pin. Place the capacitor close to the UV pin.
- If the application includes a switch as shown in Figure 3.1, locate it at the lowest voltage point to avoid sparks when switching.
- Use traces that are as short and wide as possible for any traces leading to actual ground that occur between the GND pin and Iset pin. This improves accuracy for the MAIN LED current and the under-voltage threshold.

Also see Table 5.1 for connection requirements.

# ZLED7002

Toggle (Side-Step) Dual-Channel LED Driver

The Analog Mixed Signal Company

## 4 ESD Protection

All pins have an ESD protection of  $\geq \pm 4000\text{V}$  according to the Human Body Model (HBM). The ESD test follows the Human Body Model with  $1.5\text{ k}\Omega/100\text{ pF}$  based on MIL 883-G, Method 3015.7.
