LV8729V

Bi-CMOS LSI

PWM Constant-Current Control Stepping Motor Driver

Overview

The LV8729V is a PWM current-controlled microstep bipolar stepping motor driver.

This driver can perform eight times of excitation of the second phase to 32W1-second phase and can drive simply by the CLK input.

Features

- Single-channel PWM current control stepping motor driver.
- BiCDMOS process IC.
- Output on-resistance (upper side : 0.35Ω ; lower side : 0.3Ω ; total of upper and lower : 0.65Ω ; $T_a = 25^\circ\text{C}$, $I_O = 1.8\text{A}$)
- 2-phase, 1-2 phase, W1-2 phase, 2W1-2 phase, 4W1-2 phase, 8W1-2 phase, 16W1-2 phase, 32W1-2 phase excitation are selectable.
- Advance the excitation step with the only step signal input.
- Available forward reverse control.
- Over current protection circuit.
- Thermal shutdown circuit.
- Input pull down resistance
- With reset pin and enable pin.

Specifications

Absolute Maximum Ratings at $T_a = 25^\circ\text{C}$

Parameter	Symbol	Conditions	Ratings	Unit
Maximum supply voltage	V_M max		36	V
Maximum output peak current	I_O max		1.8	A
Maximum logic input voltage	V_{IN} max		6	V
Maximum VREF input voltage	V_{REF} max		6	V
Maximum MO input voltage	V_{MO} max		6	V
Maximum DOWN input voltage	V_{DOWN} max		6	V
Allowable power dissipation	P_d max	*	3.85	W
Operating temperature	T_{opr}		-30 to +85	$^\circ\text{C}$
Storage temperature	T_{stg}		-55 to +150	$^\circ\text{C}$

* Specified circuit board : 90.0mm×90.0mm×1.6mm, glass epoxy 2-layer board, with backside mounting.

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

LV8729V

Allowable Operating Ratings at $T_a = 25^\circ\text{C}$

Parameter	Symbol	Conditions	Ratings	Unit
Supply voltage range	VM		9 to 32	V
Logic input voltage	V _{IN}		0 to 5	V
VREF input voltage range	VREF		0 to 3	V

Electrical Characteristics at $T_a = 25^\circ\text{C}$, VM = 24V, VREF = 1.5V

Parameter	Symbol	Conditions	Ratings			Unit
			min	typ	max	
Standby mode current drain	I _{Mst}	ST = "L"		70	100	μA
Current drain	IM	ST = "H", OE = "H", no load		3.3	4.6	mA
Thermal shutdown temperature	TSD	Design guarantee	150	180	200	°C
Thermal hysteresis width	ΔTSD	Design guarantee		40		°C
Logic pin input current	I _{INL}	V _{IN} = 0.8V	3	8	15	μA
	I _{INH}	V _{IN} = 5V	30	50	70	μA
Logic high-level input voltage	V _{INH}		2.0			V
Logic low-level input voltage	V _{INL}				0.8	V
Chopping frequency	Fch	Cosc1 = 100pF	70	100	130	kHz
OSC1 pin charge/discharge current	Iosc1		7	10	13	μA
Chopping oscillation circuit threshold voltage	Vtup1		0.8	1	1.2	V
	Vtdown1		0.3	0.5	0.7	V
VREF pin input voltage	Iref	VREF = 1.5V	-0.5			μA
DOWN output residual voltagr	V _{O1DOWN}	I _{down} = 1mA		40	100	mV
MO pin residual voltage	V _{O1MO}	I _{mo} = 1mA		40	100	mV
Hold current switching frequency	Fdown	Cosc2 = 1500pF	1.12	1.6	2.08	Hz
Hold current switching frequency threshold voltage	Vtup2		0.8	1	1.2	V
	Vtdown2		0.3	0.5	0.7	V
VREG1 output voltage	Vreg1		4.7	5	5.3	V
VREG2 output voltage	Vreg2	V _M	18	19	20	V
Output on-resistance	R _{onu}	I _O = 1.8A, high-side ON resistance		0.35	0.455	Ω
	R _{ond}	I _O = 1.8A, low-side ON resistance		0.3	0.39	Ω
Output leakage current	I _{Oleak}	V _M = 36V			50	μA
Diode forward voltage	VD	I _D = -1.8A		1	1.4	V
Current setting reference voltage	VRF	VREF = 1.5V, Current ratio 100%	0.285	0.3	0.315	V

LV8729V

3333

Pin Assignment

Substrate Specifications (Substrate recommended for operation of LV8729V)

Size : 90mm × 90mm × 1.6mm (two-layer substrate [2S0P])
 Material : Glass epoxy
 Copper wiring density : L1 = 85% / L2 = 90%

L1 : Copper wiring pattern diagram

L2 : Copper wiring pattern diagram

Cautions

- 1) The data for the case with the Exposed Die-Pad substrate mounted shows the values when 90% or more of the Exposed Die-Pad is wet.
- 2) For the set design, employ the derating design with sufficient margin.
 Stresses to be derated include the voltage, current, junction temperature, power loss, and mechanical stresses such as vibration, impact, and tension.
 Accordingly, the design must ensure these stresses to be as low or small as possible.
 The guideline for ordinary derating is shown below :
 (1) Maximum value 80% or less for the voltage rating
 (2) Maximum value 80% or less for the current rating
 (3) Maximum value 80% or less for the temperature rating
- 3) After the set design, be sure to verify the design with the actual product.
 Confirm the solder joint state and verify also the reliability of solder joint for the Exposed Die-Pad, etc.
 Any void or deterioration, if observed in the solder joint of these parts, causes deteriorated thermal conduction, possibly resulting in thermal destruction of IC.

Pin Functions

Pin No.	Pin Name	Pin Function	Equivalent Circuit

Reference describing operation

(1) Stand-by function

When ST pin is at low levels, the IC enters stand-by mode, all logic is reset and output is turned OFF.
When ST pin is at high levels, the stand-by mode is released.

(2) STEP pin function

Input		Operating mode
ST	STP	
Low	*	Standby mode
High		Excitation step proceeds
High		Excitation step is kept

(3) Excitation setting method

Set the excitation setting as shown in the following table by setting MD1 pin, MD2 pin and MD3 pin.

Input			Mode (Excitation)	Initial position	
MD3	MD2	MD1		1ch current	2ch current
Low	Low	Low	2 phase	100%	-100%
Low	Low	High	1-2 phase	100%	0%
Low	High	Low	W1-2 phase	100%	0%
Low	High	High	2W1-2 phase	100%	0%
High	Low	Low	4W1-2 phase	100%	0%
High	Low	High	8W1-2 phase	100%	0%
High	High	Low	16W1-2 phase	100%	0%
High	High	High	32W1-2 phase	100%	0%

The initial position is also the default state at start-up and excitation position at counter-reset in each excitation mode.

(4) Output current setting

Output current is set shown below by the VREF pin (applied voltage) and a resistance value between RF1(2) pin and GND.

$$I_{OUT} = (V_{REF} / 5) / R_{F1(2) \text{ resistance}}$$

* The setting value above is a 100% output current in each excitation mode.

(Example) When $V_{REF} = 1.1V$ and $R_{F1(2)} \text{ resistance is } 0.22\Omega$, the setting is shown below.

$$I_{OUT} = (1.1V / 5) / 0.22\Omega = 1.0A$$

(5) Output enable function

When the OE pin is set Low, the output is forced OFF and goes to high impedance. However, the internal logic circuits are operating, so the excitation position proceeds when the STP is input. Therefore, when OE pin is returned to High, the output level conforms to the excitation position proceeded by the STP input.

(6) Reset function

When the RST pin is set Low, the output goes to initial mode and excitation position is fixed in the initial position for STP pin and FR pin input. MO pin outputs at low levels at the initial position. (Open drain connection)

(7) Forward / reverse switching function

FR	Operating mode
Low	Clockwise (CW)
High	Counter-clockwise (CCW)

The internal D/A converter proceeds by a bit on the rising edge of the step signal input to the STP pin. In addition, CW and CCW mode are switched by FR pin setting.

In CW mode, the channel 2 current phase is delayed by 90° relative to the channel 1 current.

In CCW mode, the channel 2 current phase is advanced by 90° relative to the channel 1 current.

(8) EMO, DOWN, MO output pin

The output pin is open -drain connection. When it becomes prescribed, it turns on, and each pin outputs the Low level.

Pin state	EMO	DOWN	MO
Low	At detection of over-current	Holding current state	Initial position
OFF	Normal state	Normal state	Non initial position

(9) Chopping frequency setting function

Chopping frequency is set as shown below by a capacitor between OSC1 pin and GND.

$$F_{cp} = 1 / (C_{osc1} / 10 \times 10^{-6}) \text{ (Hz)}$$

(Example) When $C_{osc1} = 200\text{pF}$, the chopping frequency is shown below.

$$F_{cp} = 1 / (200 \times 10^{-12} / 10 \times 10^{-6}) = 50(\text{kHz})$$

(10) Output current vector locus (one step is normalized to 90 degrees)

(11) Current wave example in each excitation mode (2 phase, 1-2 phase, 4W1-2 phase, 32W1-2 phase)
2-phase excitation (CW mode)

1-2 phase excitation (CW mode)

4W1-2 phase excitation (CW mode)

32W1-2 phase excitation (CW mode)

(12) Current control operation
(Sine-wave increasing direction)

(Sine-wave decreasing direction)

Each of current modes operates with the follow sequence.

- The IC enters CHARGE mode at a rising edge of the chopping oscillation. (A period of CHARGE mode (Blanking Time) is forcibly present in approximately $1\mu\text{s}$, regardless of the current value of the coil current (ICOIL) and set current (IREF)).
- In a period of Blanking Time, the coil current (ICOIL) and the setting current (IREF) are compared.
 - If an $\text{ICOIL} < \text{IREF}$ state exists during the charge period:
 - The IC operates in CHARGE mode until $\text{ICOIL} \geq \text{IREF}$. After that, it switches to SLOW DECAY mode and then switches to FAST DECAY mode in the last approximately $1\mu\text{s}$ of the period.
 - If no $\text{ICOIL} < \text{IREF}$ state exists during the charge period:
 - The IC switches to FAST DECAY mode and the coil current is attenuated with the FAST DECAY operation until the end of a chopping period.

The above operation is repeated. Normally, in the sine wave increasing direction the IC operates in SLOW (+ FAST) DECAY mode, and in the sine wave decreasing direction the IC operates in FAST DECAY mode until the current is attenuated and reaches the set value and the IC operates in SLOW (+ FAST) DECAY mode.

(13) Output short-circuit protection circuit

Built-in output short-circuit protection circuit makes output to enter in stand-by mode. This function prevents the IC from damaging when the output shorts circuit by a voltage short or a ground short, etc. When output short state is detected, short-circuit detection circuit state the operating and output is once turned OFF. Subsequently, the output is turned ON again after the timer latch period (typ. 256 μ s). If the output remains in the short-circuit state, turn OFF the output, fix the output to the wait mode, and turn ON the EMO output.

When output is fixed in stand-by mode by output short protection circuit, output is released the latch by setting ST = "L".

(14) Open-drain pin for switching holding current

The output pin is an open-drain connection.

This pin is turned ON when no rising edge of STP between the input signals while a period determined by a capacitor between OSC2 and GND, and outputs at low levels.

The open-drain output in once turned ON, is turned OFF at the next rising edge of STP.

Holding current switching time (Tdown) is set as shown below by a capacitor between OSC2 pin and GND.

$$T_{down} = C_{osc2} \times 0.4 \times 10^9 \text{ (s)}$$

(Example) When C_{osc2} = 1500pF, the holding current switching time is shown below.

$$T_{down} = 1500\text{pF} \times 0.4 \times 10^9 = 0.6 \text{ (s)}$$

Application Circuit Example

The above sample application circuit is set to the following conditions:

- Output enable function fixed to the output state (OE = "H")
- Reset function fixed to the output state (RST = "H")
- Chopping frequency : 50kHz (Cosc1 = 200pF)

The set current value is as follows :

$$I_{OUT} = (\text{Current setting reference voltage} / 5) / 0.22\Omega$$

Measurement circuit diagram

Stand-by mode current drain : I_{Mstn}

Current drain : I_M

Turn OFF SW when measuring I_{Mstn} .

Turn ON SW when measuring I_M

LV8729V

Logic pin input current : I_{INL} , I_{INH}

Set $V_{IN} = 0.8V$ when measuring I_{INL} .

Set $V_{IN} = 5V$ when measuring I_{INH}

This measurement is related to the ST pin. Take the same procedure for measurement of other pins.

LV8729V

Logic input high-level voltage : V_{INH} (ST, OE)

Logic input low-level voltage : V_{INL} (ST, OE)

To measure the ST pin, set SW1 to the "a" side and SW2 to the "b" side.

To measure the OE pin, set SW1 to the "b" side and SW2 to the "a" side.

V_{INH} : When V_{IN} is raised gradually from 0V, the V_{OUT1A} voltage changes from "L" to "H". The V_{IN} voltage at which the voltage changes from "L" to "H" is the V_{INH} voltage.

V_{INL} : When V_{IN} is raised gradually from 3V, the V_{OUT1A} voltage changes from "H" to "L". The V_{IN} voltage at which the voltage changes from "H" to "L" is the V_{INL} voltage.

LV8729V

Logic input high-level voltage : V_{INH} (MD1, MD2, MD3)

Logic input high-level voltage : V_{INL} (MD1, MD2, MD3)

V_{INH} : When V_{IN} is raised gradually from 0V, the V_{OUT2B} voltage changes from "H" to "L". The V_{IN} voltage at which the voltage changes from "H" to "L" is the V_{INH} voltage.

V_{INL} : When V_{IN} is raised gradually from 3V, the V_{OUT2B} voltage changes from "L" to "H". The V_{IN} voltage at which the voltage changes from "L" to "H" is the V_{INL} voltage.

This measurement is related to the MD1 pin. Take the same procedure for measurement of MD2 and MD3 pins.

LV8729V

REG1 output voltage : Vreg1

REG2 output voltage : Vreg2

VREF pin input voltage : Iref

LV8729V

Copping frequency : Fch

MO pin residual voltage : V_{OIMO}

LV8729V

Output on-resistance : Ronu,Rond

When measuring OUT1A upper and OUT2B upper FETs, set SW1 to 4 to the "a" side.

When measuring OUT1A lower and OUT2B lower FETs, set SW1 to 4 to the "b" side.

This measurement is related to OUT1A and OUT2B. To measure OUT2A and OUT1B, enter two rectangular waves to the STP pin and carry out the procedure for measurement.

LV8729V

Current setting reference voltage : VRF

Raise the RF1 (2) pin voltage from 0V. The RF1 (2) voltage at which the OUT voltage changes from "H" to "L" is VRF.

SCILLC makes no warranty, representation or guarantee regarding the suitability of its products for any particular purpose, nor does SCILLC assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation special, consequential or incidental damages. "Typical" parameters which may be provided in SCILLC data sheets and/or specifications can and do vary in different applications and actual performance may vary over time. All operating parameters, including "Typicals" must be validated for each customer application by customer's technical experts. SCILLC does not convey any license under its patent rights nor the rights of others. SCILLC products are not designed, intended, or authorized for use as components in systems intended for surgical implant into the body, or other applications intended to support or sustain life, or for any other application in which the failure of the SCILLC product could create a situation where personal injury or death may occur. Should Buyer purchase or use SCILLC products for any such unintended or unauthorized application, Buyer shall indemnify and hold SCILLC and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that SCILLC was negligent regarding the design or manufacture of the part.
