Dynamic Random Access Memory

DESCRIPTION

The Accutek AK594096 high density memory module is a CMOS random access memory organized in 4 Meg x 9 bit words. The assembly consists of two 4 Meg x 4 and one 4 Meg x 1 DRAMs, mounted on the front side of a printed circuit board in 30 pad SIM (leadless) or 30 pin SIP (leadless) configuration with JEDEC-standard pinouts. Designed especially for low-height applications such as VMEbus boards, this low profile module is 0.550 inch high.

The operation is identical to nine 4 Meg x 1 DRAMs. For the lower eight bits, data input is tied to data output and brought out separately for each bit, with common $\overline{\text{RAS}}$ and $\overline{\text{CAS}}$ control. This common I/O feature dictates the use of early-write cycles to prevent contention of data In and data out. Since the Write-Enable ($\overline{\text{WE}}$) signal must always go low before $\overline{\text{CAS}}$ in a write cycle, Read-Write and Read-Modify-Write operation is not possible. For the ninth bit, data in (D_9) and data out (Q_9) pins are brought out separately and controlled by a separate $\overline{\text{PCAS}}$ for that bit.
