

300mA Ultra-Low Dropout Adjustable Voltage Regulators

Features

- Stable with 2.2μF Low-ESR Ceramic Capacitor
- Voltage Reference Accuracy of 2%
- Drop-out Voltage of only 320mV at 300mA and 170mV at 150mA Load Current
- Quiescent Current in Shutdown of 5μA
- Current Limit and Thermal Shutdown
- Logic Input Enable/Shutdown Pin
- RoHS-compliant halogen-free SOT-23-5

Applications

- Laptop, Notebook and Palmtop computers
- Battery Powered Equipments
- PCMCIA Vcc and Vpp Regulator
- Consumer Electronics
- High Efficiency Linear Power Supplies

Description

The APU8836 device is an efficient linear voltage regulator with better than 2% initial voltage accuracy, very low dropout voltage and very low ground current, designed especially for hand-held, battery-powered applications. Other features of the device are TTL compatible enable/shutdown control input, current-limiting and thermal shutdown.

The APU8836-HF-3 is available as an adjustable output voltage regulator in a small RoHS-compliant halogen-free SOT-23-5 package.

Ordering information

APU8836Y5-HF-3TR : in RoHS-compliant halogen-free SOT-23-5

APU8836Y5R-HF-3TR : alternate pin-out in RoHS-compliant halogen-free SOT-23-5

These products are shipped on tape and reel, 3000 pieces per reel. The device is rated MSL3 for moisture sensitivity, and the reel is shipped sealed inside a moisture barrier bag.

Electrical Specifications

Unless otherwise specified, these specifications apply over $C_{IN}=C_{O}=2.2F$, $I_O=100\mu A$, $V_{IN(MIN)}=2.5V$, $V_{OUT} = V_{FB}$, $V_{EN}=2V$ and $T_A=25^\circ C$. Typical values refer to $T_A=25^\circ C$.

Low duty cycle pulse testing is used to keep junction and case temperatures equal to the ambient temperature.

Note 1: Low duty cycle pulse testing with Kelvin connections is required in order to maintain accurate data.

Note 2: Dropout voltage is defined as the minimum differential voltage between V_{IN} and V_{OUT} required to maintain regulation at V_{OUT} .

It is measured when the output voltage drops 1% below its nominal value.

Note 3: Ground current is the regulator quiescent current plus the pass transistor current. The total current from the supply is the sum of the load current plus the ground pin current.

Pin Descriptions

PIN SYMBOL	PIN DESCRIPTION
V_{IN}	The input pin of the regulator. Typically a large storage capacitor is connected from this pin to ground to ensure that the input voltage does not sag below the minimum drop out voltage during the load transient response. This pin must always be higher than V_{OUT} by at least the amount of the dropout voltage and some margin in order for the device to regulate properly.
Gnd	Ground pin. This pin must be connected to the lowest potential in the system and all other pins must be at higher potential with respect to this pin.
En	Enable pin. A low signal or left open on this pin shuts down the output. This pin must be tied HI or to V_{IN} for normal operation.
Adj	A resistor divider from this pin to the V_{OUT} pin and ground sets the output voltage. To minimize the error due to the error amplifier, select the values of the resistor dividers to be less than $10k\Omega$.
V_{OUT}	The output of the regulator. A capacitor with a minimum value of $2.2\mu F$ and max ESR of 1Ω must be connected from this pin to ground to ensure stability.
