

TDA7266

LINEAR INTEGRATED CIRCUIT

7+7W DUAL BRIDGE AMPLIFIER

DESCRIPTION

The UTC TDA7266 is a 7+7W dual bridge amplifier specially designed for TV and Portable Radio applications.

FEATURES

- * Wide Supply Voltage Range (3 ~ 18V)
- * Minimum External Components
- * No SWR Capacitor
- * No Bootstrap
- * No Boucherot Cells
- * Internally Fixed Gain
- * Stand-BY & Mute Functions
- * Short Circuit Protection
- * Thermal Overload Protection

■ ABSOLUTE MAXIMUM RATINGS

PARAMETER	SYMBOL	RATINGS	UNIT
Supply Voltage	V_{CC}	20	V
Output Peak Current (internally limited)	I_{OUT}	2	A
Power Dissipation ($T_C = 70^\circ\text{C}$)	HZIP-15A / HZIP-15B	33	W
	HZIP-15D	20	
Junction Temperature	T_J	+125	$^\circ\text{C}$
Operating Junction Temperature	T_J	0 ~ +70	$^\circ\text{C}$
Storage Temperature	T_{STG}	-40 ~ +150	$^\circ\text{C}$

Note: Absolute maximum ratings are those values beyond which the device could be permanently damaged.

Absolute maximum ratings are stress ratings only and functional device operation is not implied.

■ APPLICATION SUGGESTION

For Microprocessor Application

In order to avoid annoying "Pop-Noise" during Turn-On/Off transients, it is necessary to guarantee the right ST-BY and MUTE signals sequence. It is quite simple to obtain this function using a microprocessor (Fig 1 and Fig 2).

At first ST-BY signal (from mP) goes high and the voltage across the ST-BY terminal (Pin 7) starts to increase exponentially. The external RC network is intended to turn-on slowly the biasing circuits of the amplifier, this to avoid "POP" and "CLICK" on the outputs.

When this voltage reaches the ST-BY threshold level, the amplifier is switched-on and the external capacitors in series to the input terminals (C3, C5) start to charge.

It's necessary to maintain the mute signal low until the capacitors are fully charged, this to avoid that the device goes in play mode causing a loud "Pop Noise" on the speakers.

A delay of 100 ~ 200ms between ST-BY and MUTE signals is suitable for a proper operation.

For Low Cost Application

In low cost applications where the mP is not present, the suggested circuit is shown in Fig 3.

The ST-BY and mute terminals are tied together and they are connected to the supply line via an external voltage divider.

The device is switched-on/off from the supply line and the external capacitor C4 is intended to delay the ST-BY and MUTE threshold exceeding, avoiding "Popping" problems.
