**DESCRIPTION**

The IP431A circuit is a monolithic three terminal programmable shunt regulator diode. This voltage reference operates as a low temperature coefficient zener which is programmable between Vref (2.5V) and 36 volts using two external resistors. The device has a wide operating current range of 1mA to 100mA and a typical dynamic impedance of 0.2Ω. Active output circuitry provides a very sharp turn-on characteristic making these devices excellent replacements for Zener Diodes in many applications. Being a shunt regulator it can be used as either a positive or negative voltage reference.
