

ZT13085E

Low Power 5V 2.5Mbps 256-Fanout RS485 Transceivers

Features

- Meets or exceeds the requirements of ANSI Standard TIA/EIA-485-A and ISO 8482:1987(E) specifications for V_{CC} at +5V \pm 10%
- Low quiescent current – 0.5mA typ., 1mA max.
- Low shutdown current (where applicable) - 1 μ A typical, 10 μ A max.
- Guaranteed standard data rate 2.5Mbps
- True Fail-Safe (Open, Short, Bus Idle) Receiver
- -7V to +12V common-mode input voltage range
- Half-Duplex mode configuration
- Allows up to 1/8 unit load (256 devices) on the same common bus
- Controlled driver output slew rate and receiver input filtering
- Active-high driver enable and active-low receiver enable
- ESD protection on bus terminals \pm 15kV Human Body Model (HBM)
- Alternative replacement for MAX3085E, MAX13082E, MAX13085E, SN75HVD3085, SN65HVD3085
- Standard fanout driving 1 unit load (32 devices) on the ZT485E Series are available options.

General Description

The ZT13085E device is a 5V differential data line transceivers for RS485/RS422 communication that consist of one driver and one receiver with high level of ESD protection. They are designed for balanced transmission lines interface that meet ANSI standard TIA/EIA-485-A and ISO 8482:1987(E) specifications.

The ZT13085E series devices spans out with half duplex, data rate guaranteed at 2.5M bit per second allow one-eighth of an unit load that fan out 256 devices sharing a common bus. The I/Os are enhanced-electrostatic discharge (ESD) protected, exceeding \pm 15kV Human Body Model (HBM).

Applications

- RS422/RS485 communications
- Utility meters
- Industrial process control
- Building automation
- Level translators
- Transceivers for EMI-sensitive applications
- Routers and HUBs
- Industrial-controlled Local Area Networks
- Industrial PCs, embedded PCs and peripherals
- Industrial, security CATV and camera applications

Product Selection Guide And Cross Reference

Part Number	Duplex	# Of Tx/ Rx	Data Rate (Mbps)	# of Tx/ Rx on Bus	Slew Rate Limit	Rx Input Filtering	Low-Power Shutdown	Tx/ Rx Enable	ESD on Tx/ Rx	Package Types	Pin-to-Pin Cross Reference
ZT13085E	Half	1/1	2.5	256	No	No	Yes	Yes	\pm 15kV	8-PDIP, 8-nSOIC	MAX3085E, MAX13082E, MAX13085E, SN65HVD3085E

Absolute Maximum Ratings

These are stress ratings only and functional operation of the device at these ratings or any other above those indicated in the operation sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods of time may affect reliability.

Power Supply, (V_{CC}).....-0.3V to +7.0V

Input Voltages

DI, DE, \overline{RE} -0.3V to ($V_{CC} + 0.3V$)

Differential Input Voltage, (V_{ID}) -12V to +12V

A, B (V_I) -9V to +13V

Output Voltages

RO -0.3V to +6.0V

Y, Z (A & B on Half Duplex) -9V to +13.0V

Operating Temperature.....-40°C to +85°C

Storage Temperature.....-65°C to +150°C

Power Dissipation Per Package

8-pin PDIP (derate 9.09mW/°C above +70°C) 722mW

8-pin nSOIC (derate 6.14mW/°C above +70°C).... 500mW

Storage Considerations

Storage in a low humidity environment is preferred. Large high density plastic packages are moisture sensitive and should be stored in Dry Vapor Barrier Bags. Prior to usage, the parts should remain bagged and stored below 40°C and 60%RH. If the parts are removed from the bag, they should be used within 168 hours or stored in an environment at or below 20%RH. If the above conditions cannot be followed, the parts should be baked for 12 hours at 125°C in order to remove moisture prior to soldering. Zywyn ships product in Dry Vapor Barrier Bags with a humidity indicator card and desiccant pack. The humidity indicator should be below 30%RH. The MSL of this product is 3.

The information furnished by Zywyn has been carefully reviewed for accuracy and reliability. Its application or use, however, is solely the responsibility of the user. No responsibility of the use of this information become part of the terms and conditions of any subsequent sales agreement with Zywyn. Specifications are subject to change without the responsibility for any infringement of patents or other rights of third parties which may result from its use. No license or proprietary rights are granted by implication or otherwise under any patent or patent rights of Zywyn Corporation.

DC Electrical Characteristics

Unless otherwise stated, $V_{CC} = +5.0V$, $T_A = T_{min}$ to T_{max} , typical values apply at $V_{CC} = +5.0V$ and $T_A = 25^\circ C$.

Parameter	Condition	Min	Typ	Max	Units
Operating Voltage & Temperature					
Temperature	Industrial Grade	-40	25	85	°C

Pin Description**(ZT13085E)**

Pin Numbers	Name	Description
1	RO	Receiver Output. If A>B by 200mV, then RO = HIGH; If A<B by 200mV, then RO = LOW
2	\overline{RE}	Receiver Output Enable. Low active input. RO is high-Z when \overline{RE} = HIGH
3	DE	Driver Output Enable. The transmitter outputs, A and B, are enabled when DE = HIGH. The outputs are high-Z when DE = LOW.
4	DI	Driver Input. A low on DI forces output A low and output B high. A high on DI will bring output A high and output B low.
5	GND	Analog Ground
6	A	Non-inverting transmitter output and non-inverting receiver input.
7	B	Inverting transmitter output and inverting receiver input.
8	V _{CC}	Power Supply Input, +5V ±10%

Circuit Description

The ZT13085E are low-power transceivers for RS-485 and RS-422 communications. The RS-485 standard is ideal for multi-drop applications and for long-distance interfaces. The TIA/EIA-485 specification allows up to 256 drivers and 256 receivers to be connected to a data bus, making it an ideal choice for multi-drop utility meter applications. RS-485 transceivers are equipped with a wide (-7V to +12V) common mode range to accommodate ground potential differences since the cabling can be as long as 4,000 feet. As RS-485 is a differential interface, data is virtually immune to noise in the transmission line.

The ZT483H is slew-rate limited, minimizing EMI and reducing reflections caused by improperly terminated cables.

RS-485 Transmitters

The ZT13085E contains a differential output line transmitter that can drive voltage into multiple loads on a terminated two-wire pair, and a receiver that accepts a differential voltage down to 200mV. The transmitter's differential output can comply with RS-485 and also RS-422 standards. The typical voltage output swing with no load is 0V to V_{CC} . With worst case loading of 54 ohms across the differential outputs, the drivers can maintain greater than 1.5V voltage levels, which is more than adequate for a differential receiver to acknowledge a logic state. The 54 ohms is the equivalent of two 120 ohm termination resistors placed on each side of the transmission line and the input impedance of 256 receivers on the line. The ZT13085E transmitter has an enable control line which is active HIGH. A logic HIGH on DE (pin 3) will enable the differential outputs. A logic LOW on DE (pin 3) will disable the transmitter outputs. While disabled, the transmitter outputs are in high impedance.

RS-485 Receivers

Each transceiver contains one differential receiver that has an input sensitivity of 200mV. The input impedance of the receivers is typically 96 kohms. A wide common mode range of -7V to +12V allows for large ground potential differences between systems.

The ZT13085E receivers have an enable control input. A logic LOW on \overline{RE} will enable the receiver, a logic HIGH on \overline{RE} will disable the receiver. The receivers are equipped with the true fail-safe feature, which guarantees that the receiver output to be in a HIGH-IMPEDANCE state when the input is left unconnected. When the receiver inputs are either open or short circuit, the receiver output will be in a HIGH state when \overline{RE} enable is LOW.

The ZT13085E transmits and receives at data rates up to 2.5Mbps.

Bus Configuration

The ZT13085E is configured as half-duplex RS485/RS422 transceivers.

Half duplex is a configuration where the transmitter outputs are connected to its receiver inputs. This application is common for two-wire interfaces where either the transmitter is active or the receiver is active. It is common to connect the enable inputs for the transmitter and receiver together so that a logic HIGH will enable the transmitter and disable the receiver. Conversely, a logic LOW will disable the transmitter and enable the transmitter. Half-duplex configurations and these devices are designed for bidirectional data transmission on multipoint twisted-pair cables for applications, such as utility meters, digital motor controllers, remote sensors and terminals, industrial process control, security stations and environmental control systems.

ESD Immunity

Electro-Static Discharge (ESD) is an important factor when implementing a serial port into a system, especially in harsh environmental conditions. These industrial strength devices provide extra protection against ESD and are intended for harsh environments where high-speed data communication is important.

The ZT13085E transceivers incorporate internal protection structures on all pins to protect against ESD charges encountered during handling and assembly. The driver outputs and receiver inputs have extra protection against static electricity as they are directly interfacing to the outside environment. As such, these pins against ESD of $\pm 15kV$ without damage in all states of the transceiver's operation in the static state. After multiple ESD events, Zywyn's ZT13085E transceivers keep working without latchup. These devices eliminate the need for external transient suppressor diodes and the associated high capacitance loading, allowing reliable high-speed data communications.

The Human Body Model has been the generally accepted ESD testing method for semiconductors. This test is intended to simulate the human body's potential to store electrostatic energy and discharge it to an integrated circuit upon close proximity or contact. This method will test the IC's capability to withstand an ESD transient during normal handling such as in manufacturing areas where the ICs tend to be handled frequently.

Function Table

ZT13085E

DRIVER				RECEIVER		
Input DI	Enable DE	Outputs		Differential Inputs $V_{ID} = V_A - V_B$	Enable \overline{RE}	Output RO
		A	B			
H	H	H	L	$V_{ID} \leq -0.2V$	L	L
L	H	L	H	$-0.2V < V_{ID} < +0.2V$	L	U
X	L	Z	Z	$+0.2V \leq V_{ID}$	L	H
X	L	Z	Z	X	H	Z*
Open	H	H	L	X	H	Z
X	Open	Z	Z	Open circuit	L	H
				Short circuit	L	H
				X	Open	Z

Note:

H = High Level; L = Low Level; Z = High Impedance; X = Irrelevant; U = Undetermined State; Z* = Shutdown.

Pin Configuration

8-Pin PDIP/nSOIC

Typical Application Circuits

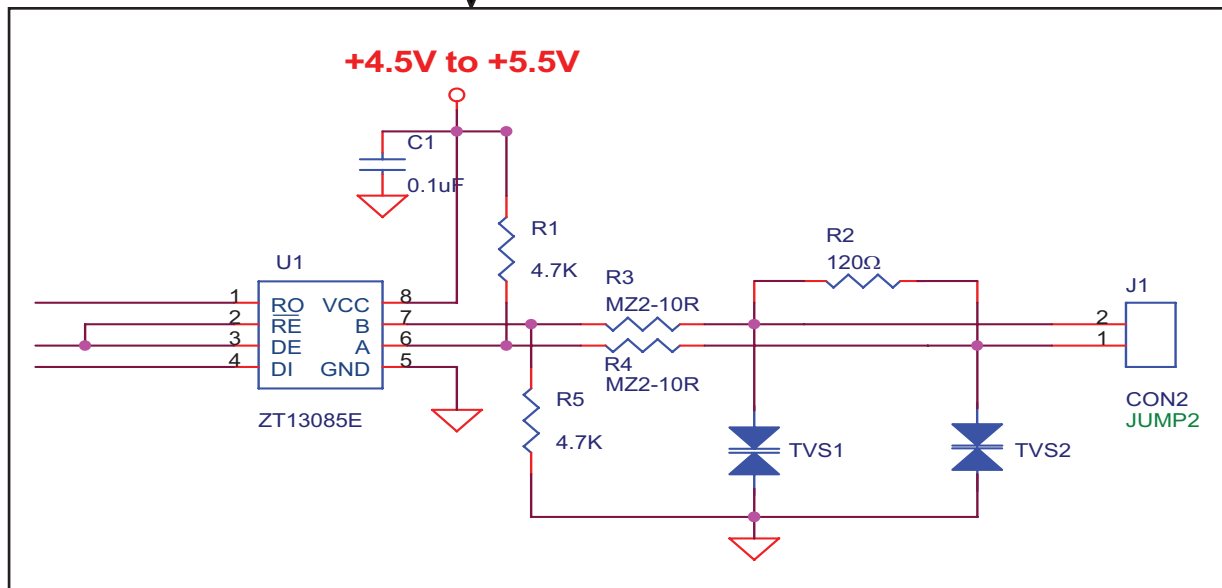

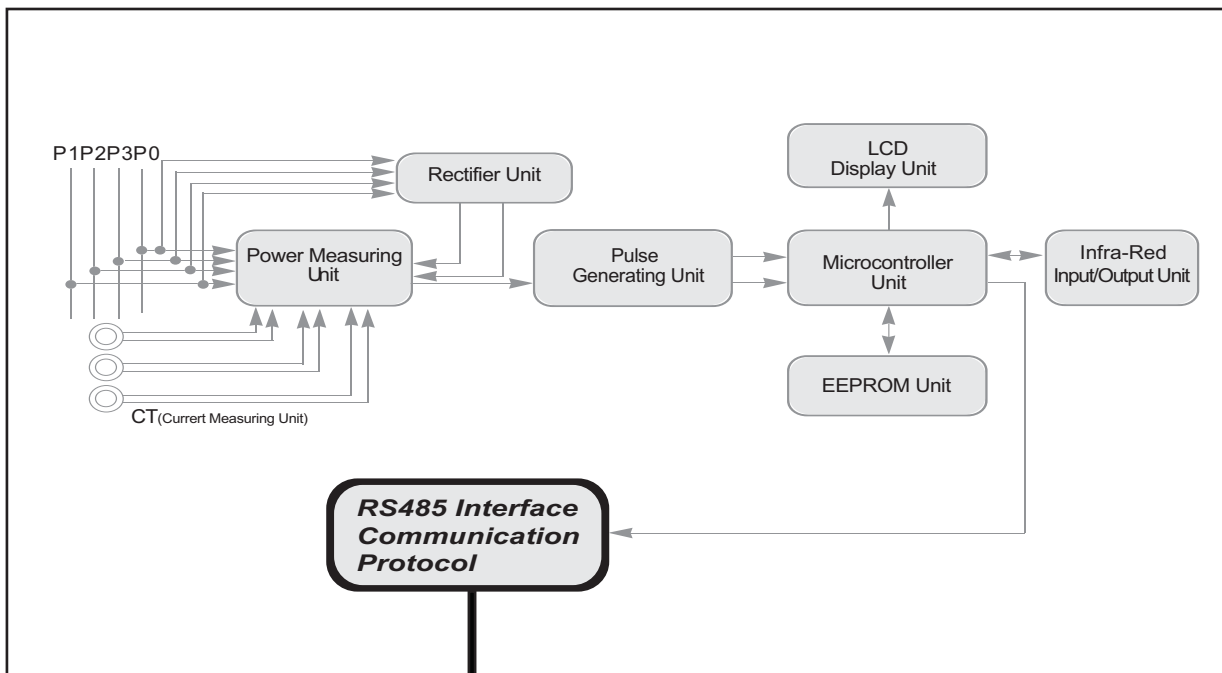

Notes:

- A. The bus should be terminated at both ends in its characteristic impedance of $R_T = Z_0$.
- B. Stub lengths off the main bus should be kept as short as possible.
- C. Can connect up to 256 devices on the same common bus.

Typical Application Circuits

Example Circuit Schematics for Utility Meter

Typical Test Circuits

Notes:

- A. The test load capacitance includes probe and test jig capacitance, unless otherwise specified.
- B. The signal generator had the following characteristics:
Pulse rate = 1000 kHz, 50% duty cycle, $Z_O = 50\Omega$, t_r & $t_f < 6\text{ns}$, unless otherwise specified.
