

Features

- Support IEEE 802.3ah™-2004 1000BASE-PX20 GEAPON OLT side application
- Single fiber bi-directional data links with symmetric 1.25Gbps upstream and downstream
- Integrated with micro-optics WDM filter for dual wavelength Tx/Rx operation at 1490/1310nm
- 1490nm continuous-mode transmitter with DFB laser
- 1310nm burst-mode receiver with APD-TIA
- Support more than 24dB dynamic range
- Digital diagnostic interface compliant with SFF-8472 Rev 9.5
- Digital Receiving Signal Strength Indication (RSSI)
- Single 3.3V power supply
- Spring-latch SFP (Small Form-factor Pluggable) package with SC receptacle optical interface.
- Operating case temperature: 0~70°C
- RoHS compliance

Regulatory Compliance

Table 1 - Absolute Maximum Ratings

Feature	Standard	Performance
Electrostatic Discharge (ESD) to the Electrical Pins	MIL-STD-883E Method 3015.7	Class 1(>500 V)
Electrostatic Discharge (ESD) to the Duplex LC Receptacle	IEC 61000-4-2	Compatible with standards
Electromagnetic Interference (EMI)	FCC Part 15 Class B EN55022 Class B (CISPR 22B)	Compatible with standards
Immunity	IEC 61000-4-3	Compatible with standards
Laser Eye Safety	FDA 21CFR 1040.10 and 1040.11 EN60950, EN (IEC) 60825-1,2	Compatible with Class I laser product.
Component Recognition	UL and CSA	Compliant with standards
RoHS	2002/95/EC 4.1&4.2 2005/747/EC	Compliant with standards ^{note}

Note:

In light of item 5 in Annex of 2002/95/EC, "Pb in the glass of cathode ray tubes, electronic components and fluorescent tubes." and item 13 in Annex of 2005/747/EC, "Lead and cadmium in optical and filter glass.", the two exemptions are being concerned for Source Photonics transceivers, because Source Photonics transceivers use glass, which may contain Pb, for components such as lenses, windows, isolators, and other electronic components.

Notes:

1. The optical power is launched into 9/125um SMF.
2. Measured with PRBS 2⁷-1 test pattern @1.25Gbps.
3. Measured with the Bessel-Thompson filter OFF.
4. Maximum sensitivity penalty due to transmitter and dispersion effect through 20km of SMF optical fiber.
5. Transmitter eye mask definition {0.22UI, 0.375UI, 0.20UI, 0.20UI, 0.30UI}.
6. Measured with a PRBS 2⁷-1 test pattern @1.25Gbps and ER=10dB, BER =10⁻¹².
7. See Figure 1, 2. For multiple ONUs application, It isn't easy to test $T_{SETTLING}$ directly, but there is a relationship $T_{SETTLING} = T_{GAP} - T_{GUARD}$ when $T_{ON} = T_{OFF}$, then $T_{SETTLING}$ can be calculated by T_{GAP} and a certain guard time at ONU side.
8. See Figure 3. T_{GAP} be less than 250ns is guaranteed.
9. An increase in optical power above the specified level will cause Los of Signal (LOS) output to switch from a high state to a low state.
10. A decrease in optical power below the specified level will cause Los of Signal (LOS) output to switch from a low state to a high state.

Notes:

- Compatible with LVPECL input, AC coupled internally. (See [Recommended Interface Circuit](#))
- TX Disable (See [Pin Function Definitions](#)).
- TX Fault (See [Pin Function Definitions](#)) Internally AC coupled.
- Supply current excluding receiver output load.
- LVPECL output, DC coupled internally, guaranteed in the full range of input optical power (-6dBm to

-31dBm) (See [Recommended Interface Circuit](#)).

Notes:

1. TX Fault is an open collector/drain output, which should be pulled up with a 4.7K-10KΩ resistor on the host board. Pull up voltage between 2.0V and V_{cc}T, R+0.3V. When high, output indicates a laser fault of some

- kind. Low indicates normal operation. In the low state, the output will be pulled to < 0.8V.
- TX disable is an input that is used to shut down the transmitter optical output. It is pulled up within the module with a 4.7-10 KΩ resistor. Its states are:
 Low (0-0.8V): Transmitter on
 (>0.8, < 2.0V): Undefined
 High (2.0-3.465V): Transmitter Disabled
 Open: Transmitter Disabled
 - MOD-DEF0,1,2. These are the module definition pins. They should be pulled up with a 4.7K-10KΩ resistor on the host board. The pull-up voltage shall be V_{ccT} or V_{ccR} .
 MOD-DEF0 is grounded by the module to indicate that the module is present
 MOD-DEF1 is the clock line of two-wire serial interface for serial ID
 MOD-DEF2 is the data line of two-wire serial interface for serial ID
 - LOS (Loss of Signal) is an open collector/drain output, which should be pulled up with a 4.7K-10KΩ resistor. Pull up voltage between 2.0V and V_{ccT} , R+0.3V. When high, this output indicates the received optical power is below the worst-case receiver sensitivity (as defined by the standard in use). Low indicates normal operation. In the low state, the output will be pulled to < 0.8V.
 - These are the differential receiver outputs. They are DC coupled 100 Ω differential lines which should be terminated with 100 Ω (differential) at the user SERDES. (See [Recommended Interface Circuit](#))
 - V_{ccR} and V_{ccT} are the receiver and transmitter power supplies. They are defined as $3.3V \pm 5\%$ at the SFP connector pin. Maximum supply current is 300 mA. Recommended host board power supply filtering is shown in figure 4. Inductors with DC resistance of less than 1Ω should be used in order to maintain the required voltage at the SFP input pin with 3.3V supply voltage. When the recommended supply filtering network is used, hot plugging of the SFP transceiver module will result in an inrush current of no more than 30 mA greater than the steady state value.
 - These are the differential transmitter inputs. They are AC coupled differential lines with 100Ω differential termination inside the module. The AC coupling is done inside the module and is thus not required on the host board. (See [Recommended Interface Circuit](#))

Warnings

Handling Precautions: This device is susceptible to damage as a result of electrostatic discharge (ESD). A static free environment is highly recommended. Follow guidelines according to proper ESD procedures.

Laser Safety: Radiation emitted by laser devices can be dangerous to human eyes. Avoid eye exposure to direct or indirect radiation.
