

iModCloud is a set of so called „cloud computing” services for NPE/iMod devices.

With the use of iModCloud you can operate groups of devices (e.g. in the same installation) and visualize data.

iModCloud user interface gives possibility to:

- preview status and change configuration
- visualize data directly from devices
- manage/update software and firmware
- create presentations and charts based on data collected from devices

## Managing Groups of Devices

iModCloud enables you to group devices into independent networks. This way you can operate selected groups of devices in one installation.

## Sharing

Depending on the type of granted permission, each device or a network of devices can be shared with other iModCloud users. You decide what and how to share. With iModCloud you can grant access to certain data to end users. You can check who has access to a specific device or a network of devices (installations) anytime you want.

## Security

All connections with other devices in iModCloud are encrypted. The security level of algorithms is the same as the ones used in electronic banking.

## Easy Registration of Devices

In order to register a device you only need to run NX Dynamics interface in your browser and click the CloudStarter tab (requires current NX Dynamics version installed on the device).

Alternatively, you can add a device directly from the iModCloud service. In this case, a one-time password is required. One-time passwords are automatically visible on your iModCloud account or you can receive them directly from TECHBASE - the manufacturer of NPE/iMod devices. This way you can share the data necessary for device registration with a third person.

## Devices Are Instantly Visible On Your Account

If you already have an authorized iModCloud account, your newly bought devices will appear on it automatically.

## New Functionalities Coming Soon

iModCloud is a new product with a set direction of development. Particularly, new functionalities related to iMod configuration and new methods of collecting and synchronizing data on the iModCloud servers will be added.
