The Barracuda Advantage

- Manages data in place, with no need to archive first
- Improves performance and shortens data backup times
- Manages Exchange capacity and mailbox quotas
- Seamless, unobtrusive end user experience
- Enables email investigation, eDiscovery and eDisclosure
- Supports organization compliance policies

Product Spotlight

- Integrated platform for archiving, compliance and search
- Single search across live and archived data for files and email
- Familiar user interface for Exchange administrators
- Intuitive console allows data to be managed by its business value
- Scales to tens of thousands of mailboxes, across multiple Exchange servers
- Compatible with all recent versions of Microsoft Exchange

Built on a simple and flexible design, ArchiveOne gives your organization ownership and control over your data and offers a single solution for capacity management, regulatory compliance, data retention and eDiscovery.

It is designed for the “real world” where email data resides not just in Exchange or Office 365, but also on network file servers and end user systems – in the form of PST files – where it is not feasible to archive all email data before enforcing retention or searching messages. The “real world” approach of ArchiveOne Enterprise separates it from the competition because it aligns with the needs of the business today and tomorrow.

ArchiveOne Enterprise seamlessly integrates with Outlook and Outlook Web Access (OWA) and the majority of customers are installed, configured and ready to archive in one day, in fact many refer to it as a “set and forget” solution. End users can access archived data from their Outlook or OWA folders, even when offline, and in the event that an archived message is deleted, they can search the archive from an integrated web-based search portal.

With end users also able to access archived message from mobile devices, ArchiveOne Enterprise really does provide a transparent end user experience.

File and email archiving

Implement capacity management based on policies to intelligently determine files, emails, attachments and calendar items to archive and what retention period to apply.

Any data found in Exchange mailboxes, public folders, client PST files or network file servers can be automatically archived to any designated storage device. And policies can be defined by age, metadata, content and many other options.

Manage and search data in place

Apply retention policies, enforce legal holds and even dispose of emails and files without first archiving the data. Automate the retention and deletion of email data to maintain compliance and minimize corporate risk.

Relevant data can be easily identified, preserved and collected for internal investigations, litigation, FOIA and eDiscovery requests.

Advanced PST Management

Systematically discover PST files throughout the organization wherever they reside and automatically determine and assign the PST file owner.

Centralize and manage PST files by copying or moving them to a central location. Eliminate them by selectively migrating data to on premise Exchange, Office 365 or ArchiveOne, then automatically disconnecting and deleting the PST files.

ArchiveOne really delivered. It offered all of the enterprise class features we needed and would not pose any disruption to our users.

Key Features

Policy-based archiving

Implement comprehensive policies to archive, preserve, collect or expire live, PST file and archived data for defensible information management.

Search data wherever it resides

Find and retrieve email data across your organization whether in live mailboxes, PST files, public folders or archived.

Compliance management

Automatically maintain compliance and manage cost of archive by enforcing corporate retention and deletion policies.

Journal archiving

Securely capture and store email communications for some or all members of your business to enforce compliance with government regulations.

Discover and Preserve Data

Identify, collect and enforce legal hold on relevant data, then review and present to meet regulatory or legal eDiscovery demands.

PST Management

Discover, centralize, migrate and eliminate PST data and control all corporate email centrally.

ArchiveOne Options

ArchiveOne Mailbox Management

Mailbox Management enables IT Administrators to effectively execute email archiving and management policies against data, in place, to reduce storage capacity, improve server performance, enforce regulatory compliance, enable eDiscovery, and more. The ability to manage data where it resides separates ArchiveOne Mailbox Management from the competition because it aligns with existing IT processes and infrastructure, rather than changes them.

ArchiveOne Journal Archiving

Journal archiving captures email directly from the Microsoft Exchange Journal, and maintains a complete and secure archive of all email activity. The biggest challenge with managing compliance is ensuring all email communication for every individual to whom various regulations apply, is captured and secured without alteration. With Journal Archiving, emails are systematically captured at the point they are sent or received. There is no possibility of user intervention, alteration, or deletion, either inadvertent or intentional.

ArchiveOne Advanced Discovery

Advanced Discovery simplifies the identification and collection of email data. It enables organizations to perform Early Case Assessment (ECA) for regulatory and legal challenges, as well as respond to eDiscovery and Freedom of Information (FOIA) requests. Using familiar workflow and terminology, and accessed via a web-based console, legal or business users are able to perform queries and collections, and to manage compliance capture, all without the direct involvement of IT staff.

ArchiveOne PST Management

PST Management extends the functionality of ArchiveOne to include PST files stored on end-user machines and file servers across the organization. PST files pose a unique problem to businesses for many reasons, and these problems are compounded because the scale of the problem is not easily quantified. PST files are usually widely scattered across the organization, and their owners and content are often unknown, so the process to manage them is difficult. The PST Management option provides highly configurable PST capabilities that address the many challenges of managing PST files and the data within them systematically and effectively.

ArchiveOne Files

Files delivers reliable file archiving and management capabilities. It solves problems associated with data accumulation and provides an immediate reduction in storage and improvement in performance. Once installed on your server, the software provides a seamless and completely transparent end-user experience requiring no desktop software to be installed on client systems. The system allows an administrator to define policies with a high degree of granularity to determine exactly how you want to manage your files. ArchiveOne Files is configured and controlled via a simple and intuitive management console.

Supported Environments

ArchiveOne Outlook Client

- Microsoft Windows XP or later
- Microsoft Outlook 2003 or later

ArchiveOne Server Components

- Microsoft Windows Server 2003 or later
- Microsoft IIS Version 6 or later
- SQL Server 2008 or later (Full or Express)
- Microsoft Exchange Server 2003 or later
- Microsoft Exchange Online or Office 365
