NOTES

1. Make all measurements directly at the pins of the supply
2. Specified for free air convection cooling
3. 100VAC minimum required for full load start up
4. Measured by paralleling 47uF/EC and 0.1uF ceramic capacitors on the output at a 20MHz band-width
5. The power supply should start up and operate normally into these capacitive loads within specified input voltage and output current ranges over the specified operating temperature range and according to Derate.

Dynamic load/Transient Response

All output voltages shall remain within regulation limits for transient/step loading and capacitive loads conditions specified in Table 1.

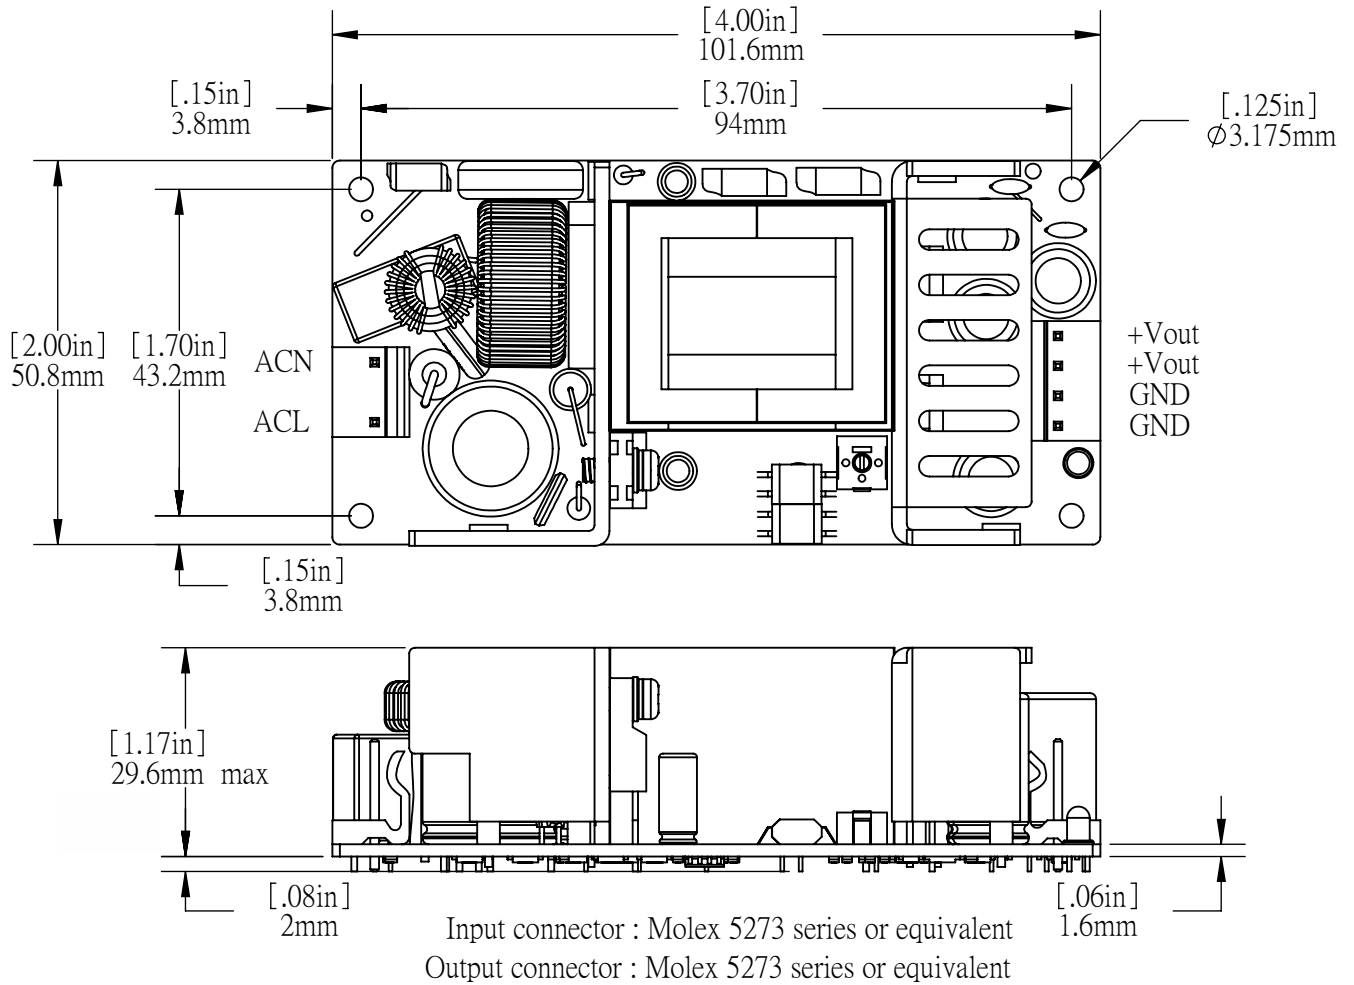

Dynamic load transient repetition rate shall be tested between 50Hz - 5KHz at duty cycle ranging from 10 - 90%. The Δ step load may occur anywhere within the min. load to max. load shown in Table 1.
