

DESCRIPTION

The BL8585 is a high-voltage adjustable current source with accurate temperature compensation. The device is designed to provide a constant current source determined by an external sense resistor R_{sense} . The current is adjustable from 10mA to 20mA with less than 10% error while input changes from 5V to 90V. With an external resistor ($R1$ in Figure 1) between V_A and I_S pin, the heat in the IC can be significantly reduced while keeping the summation of IC and $R1$ current to be constant. This is extremely useful in the area that power lines are not very stable. A typical application for the BL8585 is to drive LEDs with a constant current varies from 10-20mA. They can also be used in parallel to provide higher current according to the bias. This device is available in TO-92 package.

FEATURES

- Wide operation range: from 5V to 90V(V_{A-B})
- TO-92 packages available
- I_{LED} can be programmed from 10mA to 20mA via changing R_{sense}
- Power dissipation can be adjusted
- Easy to use, only 3 pins and very little external components are needed
- Can be paralleled for higher current
- Temperature compensated

APPLICATIONS

- Industrial lamp indicators
- LED driver
- Accent lighting
- Automotive
- Constant current source
- Constant current sink

ABSOLUTE MAXIMUM RATING

Name	Symbol	Value	Unit
Max Supply Voltage	V_{A-B}	90	V
Thermal resistance	Θ_{JA}	170	°C/W
Maximum Junction temperature	T_J	150	°C
Storage temperature	T_{st}	-55 to 150	°C

ELECTRICAL CHARACTERISTICS

Symbol	Item	Conditions	Min	Typ	Max	Unit
V_{A-B}	Operating Input Voltage	N/A	5		90	V
I_{A-B}	Current regulation	$V_{A-B}=5-90V$, $I_{SET}=20mA$	-10		+10	%
V_{IS}	Current sense voltage			0.6		V
T_J	Operating junction temperature		-45		125	°C

BLOCK DIAGRAM

OPERATION

The BL8585 is a high voltage integrated constant current driver. It can operate in a wide range from 5V to 90V, and the output current can be programmed just by change the sense resistor. This module provides a precise regulated output current, the typical application is showed in figure 1.

As the BL8585 is a linear power supply, with high input voltage, the power dissipation should be considered. For example, if the set current is 20mA, when the V_{A-B} is 5V, the module dissipation

$$P_D = V_{A-B} \times I_{SET} \Rightarrow P_D = 0.1W$$

If the V_{A-B} is 90V, the power dissipation is as high as 1.8W. An external resistor R1 can be added to reduce the power dissipation of the BL8585. Then the power dissipation on the IC becomes

$$P_D \cong V_{A-B} \times (I_{SET} - \frac{V_{A-B} - V_{Sense}}{R_1})$$

When the ambient temperature is fixed, from thermal resistance value, the maximum power dissipation of the IC can be calculated. Say the maximum allowed temperature increase is 50°C, with TO-92 package (170°C/W thermal resistance), the maximum allowed power dissipation is 0.29W. Assume the maximum V_{A-B} is 50V, $I_{set} = 20mA$, and $V_{sense} = 0.6V$. Then

$$R_1 = (V_{A-B} - V_{sense}) / (I_{SET} - \frac{P_D}{V_{A-B}}) = 3.5k\Omega$$

R1's power requirement can be calculated by

$$P_{R_1} \cong \frac{V_{A-B}^2}{R_1} = 0.71W$$

Rsense can be calculated from sense voltage and current set:

$$R_{sense} = \frac{V_{IS}}{I_{SET}} = 30\Omega$$

PACKAGE INFORMATION

Package	TO-92	Devices per reel	3000Pcs	Unit	mm
Package dimension:  The technical drawing consists of two views of the TO-92 package. The top view shows a semi-circular body with a width of 2.54 mm and a height of 3.5 ± 0.1 mm. The distance from the top edge to the center of the mounting holes is 1.25 ± 0.1 mm. The mounting holes have a diameter of $\Phi 1.5 \times 0.2$ mm. The side view shows a body with a diameter of $\Phi 4.5 \pm 0.1$ mm and a height of 4.95 ± 0.35 mm. The mounting holes are spaced 14.3 ± 0.1 mm apart. The distance from the top edge to the center of the mounting holes is 0.46 mm. The distance from the bottom edge to the center of the mounting holes is 0.5 mm. The distance from the bottom edge to the top edge of the mounting holes is 0.38 mm.
