Notes:

1. These values apply when the gate-cathode resistance $R_{GK} = 1k\Omega$
2. These values apply for continuous dc operation with resistive load. Above 70°C derate linearly to zero at 110°C .
3. This value may be applied continuously under single phase 50 Hz half-sine-wave operation with resistive load. Above 70°C derate linearly to zero at 110°C .
4. This value applies for one 50 Hz half-sine-wave when the device is operating at (or below) the rated value of peak reverse voltage and on-state current. Surge may be repeated after the device has returned to original thermal equilibrium.
5. This value applies for a maximum averaging time of 20 ms.
6. This parameters must be measured using pulse techniques, $t_w = 300\mu\text{s}$, duty cycle $\leq 2\%$, voltage-sensing contacts, separate from the current-carrying contacts, are located within 3.2mm (1/8 inch) from the device body
