

L5950

MULTIPLE MULTIFUNCTION VOLTAGE REGULATOR FOR CAR RADIO

- 5 REGULATORS
10V (350mA); 8.5V (175mA); 5V (350mA); 5V (250mA); 8V/10V (1A)
- ALL REGULATORS ARE LOW DROPOUT OUPUTS
- 3 HIGH SIDE DRIVERS:
2A (HSD1), 0.45A (HSD2 & HSD3)
- NO EXTERNAL CHARGE PUMP CAPACITORS ARE REQUIRED
- STAND BY MODE CONTROLLED BY 3 INPUT PINS:
ENABLE FOR REG2 AND REG3,
I²C BUS FOR REG1, REG4, REG5, HSD1, HSD2, HSD3
- INDIVIDUAL THERMAL SHUTDOWN
- INDEPENDENT CURRENT LIMITING
- SHORT CIRCUIT PROTECTION
- LOAD DUMP PROTECTION AND OVERVOLTAGE SHUTDOWN
- ESD PROTECTED

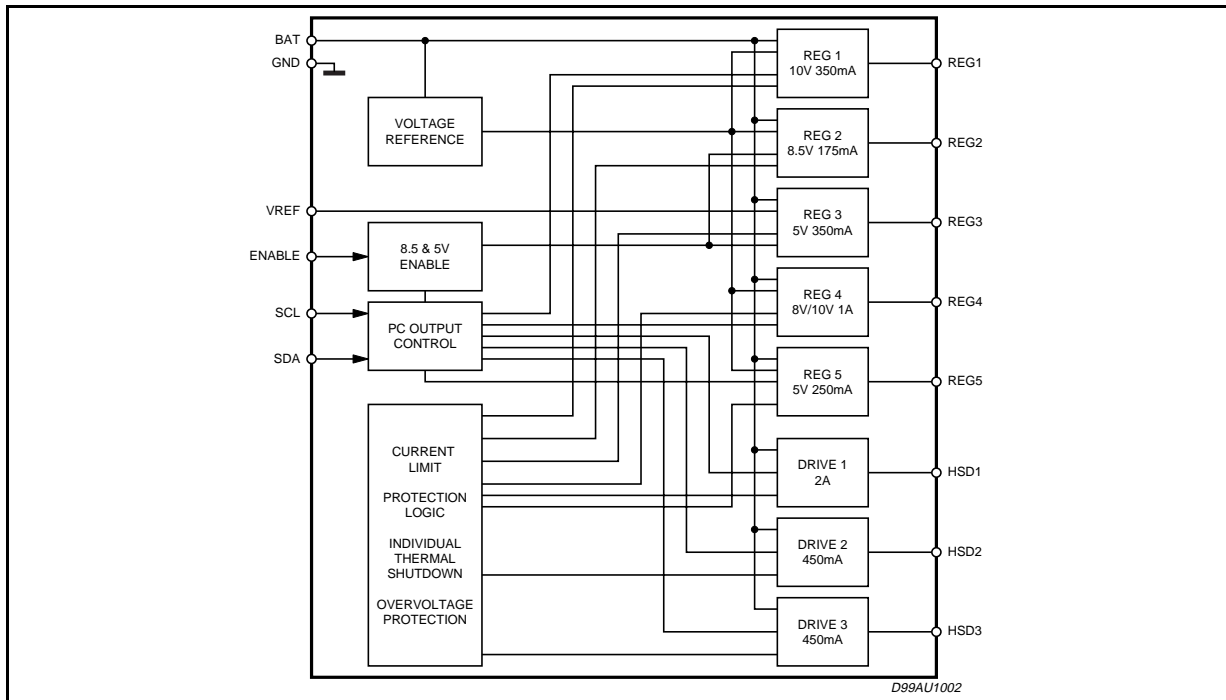

DESCRIPTION

The ASPM (Audio System Power Module) is an integration of three high side drivers and five regulators developed to provide the power for an audio system.

The outputs of the IC are controlled via the I²C bus and the Enable input.

External protection must be provided for reverse battery protection.

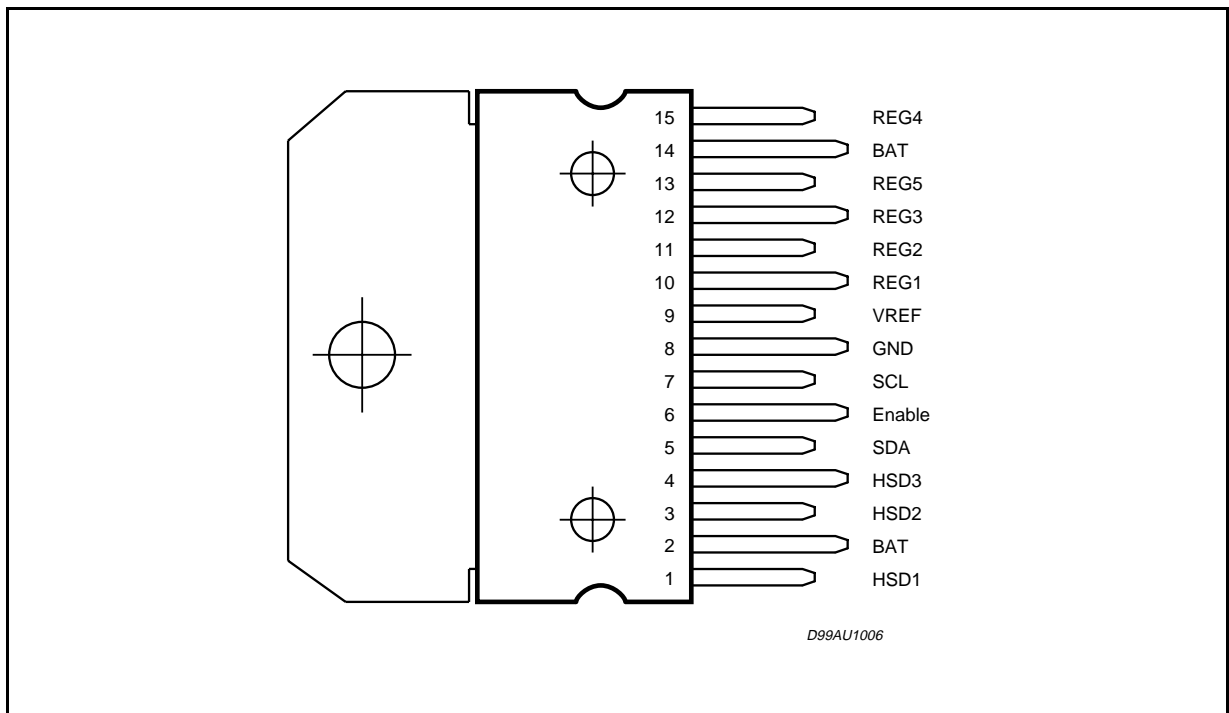

BLOCK DIAGRAM

ABSOLUTE MAXIMUM RATINGS

Symbol	Parameter	Value	Unit
V _S	DC Operating Supply Voltage	-0.6 to 26.5	V
V _S	Transient Supply Overvoltages, rise time = 10ms delay time = 115ms	34	V
V _{in}	Input Voltages (EN, SDA, SCL)	-0.6 to 9	V
V _{out}	Output Control Voltage	-0.6 to 6.0	V
T _{op}	Operating Temperature Range	-40 to 85	°C
T _{stg}	Storage Temperature Range	-40 to 150	°C

FUNCTIONAL DESCRIPTION

The three high side drivers are a 2.0A output (HSD1), and two 450mA outputs (HSD2 & 3). The five regulator outputs are a 10V at 350mA (REG1), an 8.5V at 175mA (REG2), a 5V at 350mA (REG3), an 8V/10V at 1A (REG4), and 5V at 250mA (REG5). The regulators are low dropout. The regulators will operate with output capacitors with ESR of 0.1Ω to 5Ω.

The 8.5V regulator output (REG2) is a tighter tolerance output than the other regulator outputs. The 8.5V output is a ±2.5% (5% total range) output over temperature. This is required on the regulator to improve performance and reduce cost on the 8.5V driven IC's in the radio. The tighter tolerance is possible by performing a trim of the bandgap reference to the 8.5V output. The other outputs are ±5% variation over temperature.

REG3 is referenced from the VREF input not the internal bandgap. This is done to minimize the voltage offset between individual 5V supplies.

The REG2 and REG3 outputs are turned on and off with the Enable input, a '1' turns the outputs on and a '0' turns them off. When Enable is "1", the other outputs can be independently controlled via the I²C bus. When a given regulator is turned off it must be guaranteed to be lower than 0.2V. The output voltage of REG4 is selected via bit 5 of the I²C data byte: 8V is the output voltage if bit5 = '0'

while 10V is the output voltage when bit5 = '1'. When all outputs are turned off the total current draw must be minimized. I²C will run at a clock speed range of 100kHz to 400kHz. This device should be capable of operating at any frequency within this range.

Protection

The L5950 can survive under the following conditions: shorting the outputs to BAT and GND, loss of BAT, loss of IC GND, double battery(+26.5V), 4000V ESD, 34V load dump. L5950 will not handle a reverse battery condition. External components must be implemented for reverse battery protection.

Thermal Shutdown: REG1, REG2, REG3, REG4, REG5 outputs shutdown at 160°C and return to normal operation at 130°C. The HSD2 and HSD3 shutdown at 160°C and return to normal operation at 130°C. The HSD1 will go into thermal shutdown at 170°C and returns to operation at 120°C.

Current Limiting: each voltage regulator will contain its own current protection.

Short Circuit: If the outputs are short circuited, the IC will go into current limiting and eventually the thermal shutdown will kick in. Current limiting will not disable the outputs.

Overvoltage: The IC will not operate if the BAT voltage reaches 27V typ. or above.

Figure 1. Definition of Timing on the I²C Bus.

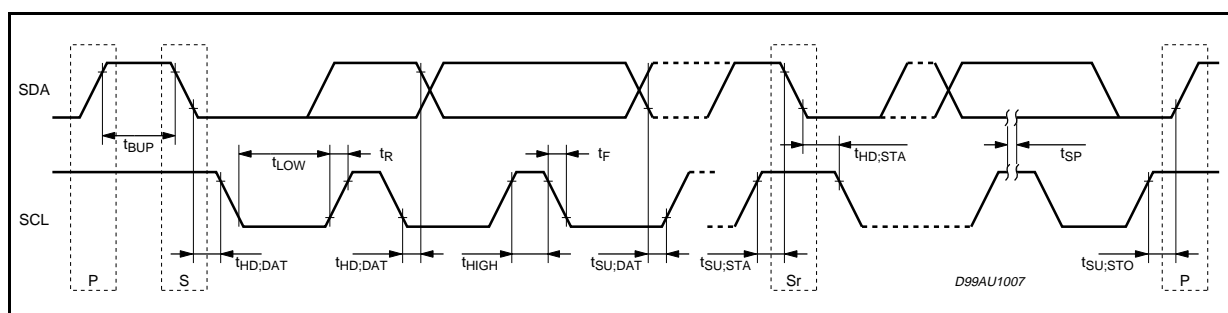

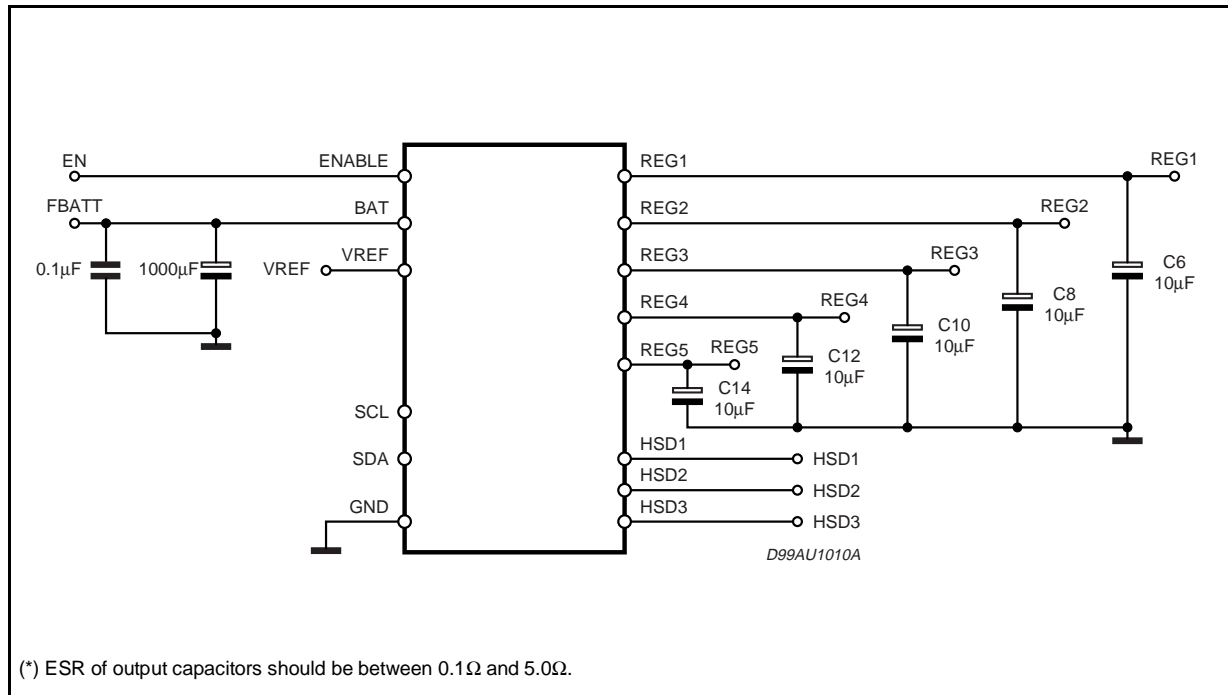

Figure 2. Typical Application Circuit.

WRITE MODE:

S = START condition - SDA goes from high to low while SCL is high

A = Acknowledge - the device being written to, pulls down on data line (SDA) during the acknowledge clock pulse.

P = STOP condition - SDA goes from low to high while SCL is high.

CHIP ADDRESS BYTE:

CHIP ADDRESS							READ/WRITE
A7	A6	A5	A4	A3	A2	A1	A0
0	0	0	1	0	0	0	0

DATA BYTE:

DATA BYTE							
REG1		R4 10V	REG4	REG5	HSD1	HSD2	HSD3
b7	b6	b5	b4	b3	b2	b1	b0
	X						

Default mode is 0000 0000 which corresponds to all outputs being off, low power mode.

Bit 5 Controls the output voltage of REG4. A '0' corresponds to 8V and a '1' corresponds to 10V.
