### SM843256

10 Gigabit Ethernet and SONET, 6 output, **Ultra-Low Jitter LVPECL Frequency Synthesizer** 

### **General Description**

The SM843256 provides a low-noise timing solution for high speed, high accuracy synthesis of clock signals. Common applications include SONET, Gigabit Ethernet, 10 Gigabit Ethernet, and similar networking standards. It includes a unique power reduction methodology, along with a patented RotaryWave<sup>TM</sup> architecture that provides a very stable clock with very low noise.

Power supplies of either 3.3V or 2.5V are supported, with superior jitter and phase noise performance. The device synthesizes different low noise LVPECL frequencies such as 125MHz, 156.25MHz, 312.5MHz, and 625MHz for Ethernet applications; 77.76MHz, 155.52MHz, 311.04MHz, and 622.08MHz for SONET applications. The crystal reference frequencies used include 25MHz and 19.44Mhz for Ethernet and SONET applications. respectively.

The SM843256 is an excellent replacement for IDT Femtoclocks, with improved accuracy, power consumption, waveform integrity, and jitter.

Data sheets and support documentation can be found on Micrel's web site at: www.micrel.com.

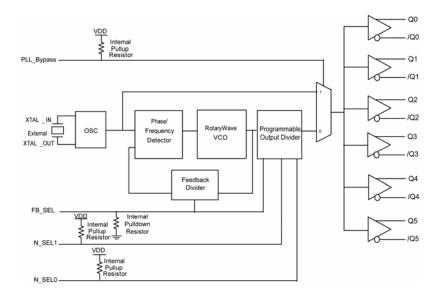

#### **Features**

- · Generates six LVPECL outputs
- 2.5V or 3.3V operating range
- Typical phase jitter @ 156.25MHz (1.875MHz to 20MHz): 80fs (typical) @ 3.3V
- 75MHz to 625MHz output frequencies
- Industrial temperature range
- Green, RoHS, and PFOS compliant
- Available in 24-pin TSSOP EPAD
- Operating supply modes: Core/Output 3.3V/3.3V, 3.3V/2.5V, 2.5V/2.5V

### **Applications**

- SONET
- Gigabit Ethernet
- 10-Gigabit Ethernet
- Infiniband

### Notes:

- 1. Permanent device damage may occur if absolute maximum ratings are exceeded. This is a stress rating only and functional operation is not implied at conditions other than those detailed in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
- 2. The data sheet limits are not guaranteed if the device is operated beyond the operating ratings.
- 3. Package thermal resistance assumes exposed pad is soldered (or equivalent) to the devices most negative potential on the PCB.
- 4. The circuit is designed to meet the DC specifications shown in the above table after thermal equilibrium has been established.
