BLOCK DIAGRAM

DESCRIPTION

The SY89322V is a dual TTL/CMOS-to-differential PECL translator capable of running from a 3.3V or 5V supply. This part can be used in either LVTTL/LVCMOS/LVPECL or TTL/CMOS/PECL systems.

It requires only a single positive supply of +3.3V or +5V, no negative supply is required.

The SY89322V is functionally equivalent to the SY100EPT22V, but in an ultra-small 8-lead MLF® package that features a 70% smaller footprint. The ultra-small package and the low skew, dual gate design of the SY89322V makes it ideal for those applications where space, performance and low power are at a premium.

Notes:

1. Permanent device damage may occur if absolute maximum ratings are exceeded. This is a stress rating only and functional operation is not implied at conditions other than those detailed in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
2. The data sheet limits are not guaranteed if the device is operated beyond the operating ratings.
3. Package thermal resistance assumes exposed pad is soldered (or equivalent) to the devices most negative potential on the PCB.

AC ELECTRICAL CHARACTERISTICS

$V_{CC} = +3.3V \pm 10\%$ or $+5.0V \pm 10\%$; $R_L = 50\Omega$ to $V_{CC} - 2V$, $T_A = -40^\circ C$ to $+85^\circ C$, unless otherwise noted.

	Total Jitter	Note 6			25	ps _{PP}
t_r, t_f	Output Rise/Fall Time (20% to 80%)		200		500	ps

Notes:

- Same transition at common V_{CC} levels.
- Cycle-to-cycle jitter definition: The variation of periods between adjacent cycles, $T_n - T_{n-1}$, where T is the time between rising edges of the output signal.
- Total jitter definition: with an ideal clock input of frequency $\leq f_{MAX}$, no more than one output edge in 10^{12} output edge will deviate by more than the specified peak-to-peak jitter value.
