

## Quad USB Power Control Switch

**Refer to MIC2027**

The MIC2524/7 is available in active-high and active-low versions in 16-pin DIP and SOIC packages.

- Compliant to USB specifications
- UL Recognized Component
- 4 independent switches
- 3V to 5.5V input
- 500mA minimum continuous load current per port
- 140m $\Omega$  maximum on-resistance (MIC2524)
- 1.25A maximum short circuit current limit
- Individual open-drain fault flag pins
- 220 $\mu$ A on-state supply current
- 1 $\mu$ A typical off-state supply current
- Output can be forced higher than input (off-state)
- Thermal shutdown
- 2.4V typical undervoltage lockout (UVLO)
- 1ms turn-on (soft-start) and fast turnoff
- Active-high or active-low enable versions
- 16-pin SOIC and DIP packages

- USB bus-powered hubs
- USB self-powered hubs
- USB monitors
- USB printers

## Pin Configuration

16-Pin SOIC (WM)  
16-Pin DIP (N)

Functional Pinout

## Pin Description

Pin Number	Pin Name	Pin Function
1	FLGA	Flag A: (Output): Channel A open-drain fault flag output.
2	ENA	Enable A (Input): Channel A control input.
3	OUTA	Output A: Channel A switch output.
4, 12	GND	Ground: Supply return. Connect both pins to ground.
5	IN(C/D)	Supply Input: Channel C and D switch, logic, and charge-pump supply input.
6	OUTC	Output C: Channel C switch output.
7	ENC	Enable C (Input): Channel C control input.
8	FLGC	Flag C (Output): Channel C open-drain fault flag output.
9	FLGD	Flag D (Output): Channel D open-drain fault flag output.
10	END	Enable D (Input): Channel D control input.
11	OUTD	Output D: Channel D switch output.
13	IN(A/B)	Supply Input: Channel A and B switch, logic, and charge-pump supply input.
14	OUTB	Output B: Channel B switch output.
15	ENB	Enable B (Input): Channel B control input.
16	FLGB	Flag B (Output): Channel B open-drain fault flag output.

**Absolute Maximum Ratings (Note 1)**

Supply Voltage ( $V_{IN}$ )	+6V
Fault Flag Voltage ( $V_{FLG}$ )	+6V
Fault Flag Current ( $I_{FLG}$ )	50mA
Output Voltage ( $V_{OUT}$ )	+6V
Output Current ( $I_{OUT}$ )	Internally Limited
Control Input ( $V_{EN}$ )	–0.3V to 12V
Storage Temperature ( $T_S$ )	–65°C to +150°C
Lead Temperature (Soldering 5 sec.)	260°C
ESD Rating, <b>Note 3</b>	2kV

**Operating Ratings (Note 2)**

Supply Voltage ( $V_{IN}$ )	+3V to +5.5V
Ambient Operating Temperature ( $T_A$ )	–40°C to +85°C
Thermal Resistance	
SOIC ( $\theta_{JA}$ )	120°C/W
DIP( $\theta_{JA}$ )	130°C/W

**Electrical Characteristics**

$V_{IN} = +5V$ ;  $T_A = 25^\circ C$ ; unless noted.

Parameter	Condition	Min	Typ	Max	Units
Supply Current	<b>Note 4</b> , switch off, OUT = open		1.5	10	$\mu A$
	<b>Note 4</b> , all switches on, OUT = open		220	320	$\mu A$
Enable Input Threshold	low-to-high transition		2.1	2.4	V
	high-to-low transition, <b>Note 4</b>	0.8	1.9		V
Enable Input Current	$V_{EN} = 0V$ to 5.5V	–1	$\pm 0.01$	1	$\mu A$
Enable Input Capacitance			1		pF
Switch Resistance	MIC2524, $I_{OUT} = 500mA$ , each switch		100	140	m $\Omega$
	MIC2527, $I_{OUT} = 500mA$ , each switch		200	300	m $\Omega$
Output Turn-On Delay	$R_L = 10\Omega$ each output		0.5		ms
Output Turn-On Rise Time	$R_L = 10\Omega$ each output		1		ms
Output Turnoff Delay	$R_L = 10\Omega$ each output		1	20	$\mu s$
Output Turnoff Fall Time	$R_L = 10\Omega$ each output		1	20	$\mu s$
Output Leakage Current	each output (output disabled)			10	$\mu A$
Continuous Load Current	each output	0.5			A
Short-Circuit Current Limit	each output (enable into load), $V_{OUT} = 4.0V$	0.5	0.75	1.25	A
Current-Limit Threshold	ramped load applied to enabled output, $V_{OUT} \leq 4.0V$ , <b>Note 5</b>		1.6	2.2	A
Overtemperature Shutdown Threshold	$T_J$ increasing		135		$^\circ C$
	$T_J$ decreasing		125		$^\circ C$
Error Flag Output Resistance	$V_{IN} = 5V$ , $I_L = 10mA$		10		$\Omega$
	$V_{IN} = 3.3V$ , $I_L = 10mA$		15		$\Omega$
Error Flag Off Current	$V_{FLAG} = 5V$		0.01	1	$\mu A$
UVLO Threshold	$V_{IN} =$ increasing		2.5		V
	$V_{IN} =$ decreasing		2.3		V

**Note 1.** Exceeding the absolute maximum rating may damage the device.

**Note 2.** The device is not guaranteed to function outside its operating rating.

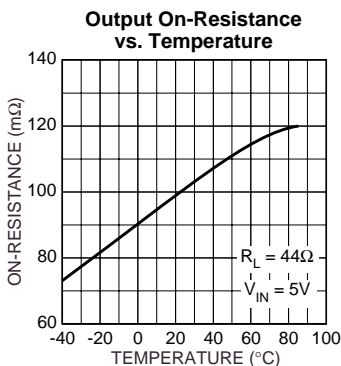

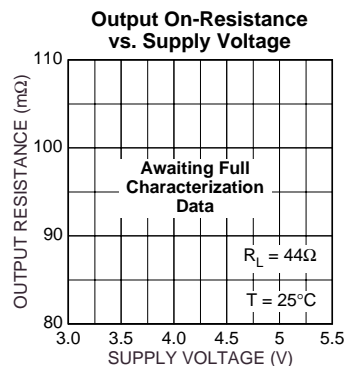

**Note 3.** Devices are ESD sensitive. Handling precautions recommended. Human body model, 1.5k in series with 100pF.

**Note 4.** Off is  $\leq 0.8V$  and on is  $\geq 2.4V$  for the MIC252x-1. Off is  $\geq 2.4V$  and on is  $\leq 0.8V$  for the MIC252x-2. The enable input has approximately 200mV of hysteresis. See control threshold charts.

**Note 5.** See “Functional Characteristics: Current-Limit Response” photo.

## Functional Description

The MIC2524/7-1 and MIC2524/7-2 are quad high-side switches with active-high and active-low enable inputs, respectively. Fault conditions turn off or inhibit turn-on of one or more of the output transistors, depending upon the type of fault, and activate the open-drain error flag transistors making them sink current to ground.

### Input and Output

IN (input) is the power supply connection to the logic circuitry and the drain of the output MOSFET. OUTx (output) is the source of its respective MOSFET. In a typical circuit, current flows through the switch from IN to OUT toward the load. If  $V_{OUT}$  is greater than  $V_{IN}$ , current will flow from OUT to IN since the MOSFET is bidirectional when on.

The output MOSFET and driver circuitry are also designed to allow the MOSFET source to be externally forced to a higher voltage than the drain ( $V_{OUT} > V_{IN}$ ) when the output is off. In this situation, the MIC2524/7 prevents reverse current flow. If  $V_{IN} < 2.5V$ , UVLO disables both switches.

### Thermal Shutdown

Thermal shutdown shuts off the affected output MOSFETs and signals all fault flags if the die temperature exceeds 135°C. 10°C of hysteresis prevents the switch from turning on until the die temperature drops to 125°C. Overtemperature detection functions only when at least one switch is enabled.

### Current Limit Induced Thermal Shutdown

Internal circuitry increases the output MOSFET on-resistance until the series combination of the MOSFET on-resistance and the load impedance limit current to typically 850mA. The increase in power dissipation, in most cases, will cause the MIC2524/7 to go into thermal shutdown, disabling affected channels. When this is undesirable, thermal shutdown can be avoided by externally responding to the fault and disabling the current limited channel before the shutdown temperature is reached. The delay between the flag indication of a current limit fault and thermal shutdown will vary with ambient temperature, board layout, and load impedance, but is typically several hundred milliseconds. The USB controller must therefore recognize a fault and disable the appropriate channel within this time. If the fault is not removed or the switch is not disabled within this time, then the device will enter into a thermal oscillation of about 2Hz. This does not cause any damage to the device. Refer to "Functional Characteristics: Thermal Shutdown Response."

## Undervoltage Lockout

UVLO (undervoltage lockout) prevents the output MOSFET from turning on until  $V_{IN}$  exceeds approximately 2.5V. In the undervoltage state, the FLAG will be low. After the switch turns on, if the voltage drops below approximately 2.3V, UVLO shuts off the output MOSFET and signals fault flag. Undervoltage detection functions only when at least one switch is enabled.

### Current Sensing and Limiting

The current-limit threshold is preset internally. The preset level prevents damage to the output MOSFET and external load but allows a minimum current of 0.5A through the output MOSFET of each channel.

The current-limit circuit senses a portion of the output FET switch current. The current sense resistor shown in the block diagram is virtual and has no voltage drop. The reaction to an overcurrent condition varies with three scenarios:

#### Switch Enabled into Short Circuit

If a switch is powered on or enabled into a heavy load or short-circuit, the switch immediately goes into a constant-current mode, reducing the output voltage. The fault flag goes low until the load is reduced. See the "Functional Characteristics: Short Circuit Response, Enabled into Short Circuit" photo.

#### Short Circuit Applied to Output

When a heavy load is applied, a large transient current may flow until the current limit circuitry will respond. Once this occurs, the device limits current to less than the short-circuit current limit specification. See the "Short Circuit Transient Response, Short Applied to Output" graph.

#### Current-Limit Response

The MIC2524/7 current-limit profile exhibits a small foldback effect of approximately 500mA. Once this current-limit threshold is exceeded the device enters constant-current mode. This constant current is specified as the short circuit current limit in the "Electrical Characteristics" table. It is important to note that the MIC2524/7 will deliver load current up to the current-limit threshold which is typically 1.6A. Refer to "Functional Characteristics: Current-Limit Response" photo for details.

### Fault Flag

FLG is an N-channel, open-drain MOSFET output. The fault-flag is active (low) for one or more of the following conditions: undervoltage (while  $2V < V_{IN} < 2.7$ ), current limit, or thermal shutdown. The flag output MOSFET is capable of sinking a 10mA load to typically 100mV above ground. Multiple FLG pins may be "wire NORed" to a common pull-up resistor.

## Applications Information

### Supply Filtering

A 0.1 $\mu$ F to 1 $\mu$ F bypass capacitor from IN to GND, located at the device, is strongly recommended to control supply transients. Without a bypass capacitor, an output short may cause sufficient ringing on the input (from supply lead inductance) to damage internal control circuitry.

*Input or output transients must not exceed the absolute maximum supply voltage ( $V_{IN\ max} = 7V$ ) even for a short duration.*

Figure 1. Supply Bypassing

### Enable Input

EN must be driven logic high or logic low for a clearly defined input. Floating the input may cause unpredictable operation. EN should not be allowed to go negative with respect to GND.

### Soft Start

The MIC2524/7 presents a high impedance when off, and slowly becomes a low impedance as it turns on. This reduces inrush current and related voltage drop that results from charging a capacitive load, satisfying the USB voltage droop requirements.

### Transient Overcurrent Filter

When the MIC2524/7 is enabled, large values of capacitance at the output of the device will cause inrush current to exceed the short circuit current-limit threshold of the device and assert the flag. The duration of this time will depend on the size of the output capacitance. Refer to the "Functional Characteristics" turn-on and turnoff behaviors for details. During the capacitance charging time, the device enters into constant-current mode. As the capacitance is charged, the current decreases below the short circuit current-limit threshold, and the flag will then be deasserted.

In USB applications, it is required that output bulk capacitance is utilized to support hot-plug events. When the MIC2524/7 is enabled, the flag may go active for about 1ms due to inrush current exceeding the current-limit setpoint. Additionally, during hot-plug events, inrush currents may also cause the flag to go active for 30 $\mu$ s. Since these conditions are not valid overcurrent faults, the USB controller must ignore the flag during these events. To prevent this erroneous overcurrent reporting, a 1ms RC filter as shown in Figure 2 may be used. Alternatively, a 1ms debounce routine may be programmed into the USB logic controller, eliminating the need for the RC filter.

Figure 2. Transient Filter
