Quad ECL/PECL Differential Buffers/Receivers

MAX9401/MAX9404

General Description

The MAX9401/MAX9404 are extremely fast and low-skew quad ECL/PECL differential buffers/receivers for data and clock signals. The four channels can be operated synchronously with an external clock, or in asynchronous mode, determined by the state of the SEL input. An enable input provides the ability to force all the outputs to a differential low state.

The MAX9401 has high-impedance (open) input and the MAX9404 has an integrated 100Ω differential input termination, which reduces external component count. Both devices have double amplitude swing open emitter outputs suitable for driving long cables. The MAX9401/MAX9404 operate over a $V_{CC} - V_{EE} = +3.0V$ to $+5.5V$ supply range, and are specified for operation from $-40^{\circ}C$ to $+85^{\circ}C$. These devices are offered in space-saving 32-pin 5mm x 5mm QFN exposed-paddle (EP) and TQFP packages.

Applications

Data and Clock Driver and Buffer
Central Office Backplane Clock Distribution
DSLAM Backplane
Base Station
ATE

Functional Diagram appears at end of data sheet.

Features

- ◆ Differential Double-Swing ECL/PECL Outputs
- ◆ Input Compatible with LVECL/LVPECL
- ◆ Guaranteed 900mV Differential Output at 3.0GHz Clock Rate
- ◆ 365ps Propagation Delay in Asynchronous Mode
- ◆ 10ps Channel-to-Channel Skew in Synchronous Mode
- ◆ Integrated 100Ω Input Terminations (MAX9404)
- ◆ Compatible +3.3V/+5.0V Nominal Supplies
- ◆ Selectable Synchronous/Asynchronous Operation

Ordering Information

PART	TEMP. RANGE	PIN-PACKAGE	INPUT IMPEDANCE
MAX9401EGJ*	-40°C to +85°C	32 QFN-EP** (5mm x 5mm)	Open
MAX9401EHJ	-40°C to +85°C	32 TQFP (5mm x 5mm)	Open
MAX9404EGJ*	-40°C to +85°C	32 QFN-EP** (5mm x 5mm)	100Ω

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

DC ELECTRICAL CHARACTERISTICS

(V_{CC} - V_{EE} = +3.0V to +5.5V, outputs terminated with 50Ω ±1% to V_{CC} - 3.3V, inputs are driven, unless otherwise noted. Typical values are at V_{CC} - V_{EE} = +3.3V, V_{IHD} = V_{CC} - 0.9V, V_{I LD} = V_{CC} - 1.7V, T_A = +25°C, unless otherwise noted.) (Notes 1, 2, 3)

Note 1: Measurements are made with the device in thermal equilibrium.

Note 2: Current into a pin is defined as positive. Current out of a pin is defined as negative. All voltages are referenced to V_{EE} except V_{ID} and V_{OD} .

Note 3: DC parameters are production tested at $T_A = +25^\circ C$. DC limits are guaranteed by design and characterization over the full operating range.

Note 4: Outputs are open. Inputs driven high or low.

Note 5: Guaranteed by design and characterization. Limits are set to ± 6 sigma.

Note 6: Measured between outputs of the same part at the signal crossing points for a same-edge transition.

Note 7: Device jitter added to the input signal.

Quad ECL/PECL Differential Buffers/Receivers

Typical Operating Characteristics

(Outputs terminated with 50Ω to $V_{CC} - 3.3V$, $V_{CC} - V_{EE} = +3.3V$, $V_{IH} = V_{CC} - 0.9V$, $V_{ILD} = V_{CC} - 1.7V$, output is enabled, $\overline{SEL} = \text{high}$, $\overline{SEL} = \text{low}$, input transition time = 125ps (20% to 80%), $f_{CLK} = 3.0\text{GHz}$, $f_{IN} = 1.5\text{GHz}$, $T_A = +25^\circ\text{C}$, unless otherwise noted.)

Pin Description

PIN	NAME	FUNCTION
1, 8, 11, 17, 24, 30	V_{CC}	Positive Supply Voltage. Bypass V_{CC} to V_{EE} with $0.1\mu\text{F}$ and $0.01\mu\text{F}$ ceramic capacitors. Place the capacitors as close to the device as possible with the smaller value capacitor closest to the device.
2	SEL	Noninverting Differential Select Input. Setting SEL = high and $\overline{SEL} = \text{low}$ (differential high) enables all four channels to operate asynchronously. Setting SEL = low and $\overline{SEL} = \text{high}$ (differential low) enables all four channels to operate in synchronized mode.
3	\overline{SEL}	Inverting Differential Select Input
4	\overline{CLK}	Inverting Differential Clock Input. A rising edge on CLK (and falling on \overline{CLK}) transfers data from the inputs to the outputs when SEL = low.
5	CLK	Noninverting Differential Clock Input

Quad ECL/PECL Differential Buffers/Receivers

MAX9401/MAX9404

Pin Description (continued)

PIN	NAME	FUNCTION
6	EN	Noninverting Differential Output Enable Input. Setting EN = high and \overline{EN} = low (differential high) enables the outputs. Setting EN = low and \overline{EN} = high (differential low) sets the outputs to logic low.
7	\overline{EN}	Inverting Differential Output Enable Input
9	IN3	Noninverting Differential Input 3
10	$\overline{IN3}$	Inverting Differential Input 3
12	$\overline{OUT3}$	Inverting Differential Output 3
13	OUT3	Noninverting Differential Output 3
14, 20, 21, 27	V _{EE}	Negative Supply Voltage
15	IN2	Noninverting Differential Input 2
16	$\overline{IN2}$	Inverting Differential Input 2
18	$\overline{OUT2}$	Inverting Differential Output 2
19	OUT2	Noninverting Differential Output 2
22	OUT1	Noninverting Differential Output 1
23	$\overline{OUT1}$	Inverting Differential Output 1
25	$\overline{IN1}$	Inverting Differential Input 1
26	IN1	Noninverting Differential Input 1
28	OUT0	Noninverting Differential Output 0
29	$\overline{OUT0}$	Inverting Differential Output 0
31	$\overline{IN0}$	Inverting Differential Input 0
32	IN0	Noninverting Differential Input 0
—	EP*	Exposed Paddle. EP is electrically connected to V _{EE} . Solder EP to PC board.

*QFN-EP package only.

Detailed Description

The MAX9401/MAX9404 are extremely fast, low-skew quad ECL/PECL buffers/receivers designed for high-speed data and clock driver applications. These devices feature ultra-low propagation delay of 365ps and channel-to-channel skew of 15ps in asynchronous mode with 84mA supply current, making them ideal for driving long cables and double termination applications (*Functional Diagram*).

The four channels can be operated synchronously with an external clock, or in asynchronous mode, determined by the state of the SEL input. An enable input

provides the ability to force all the outputs to a differential low state.

Data Input Termination

Figure 1 shows the input and output configuration of the MAX9401/MAX9404. The MAX9401 has high-impedance inputs and requires external termination. The MAX9404 has integrated 100Ω differential input termination resistors across each of the four inputs (IN_{_} to \overline{IN}_-), reducing external component count.

Outputs

The MAX9401/MAX9404 have double-swing open-emitter outputs as shown in Figure 1. The double-amplitude swing outputs can drive double-terminated links or long

Quad ECL/PECL Differential Buffers/Receivers

Figure 1. MAX9401/MAX9404 Input and Output Configurations

cables. External termination is required. See the *Output Termination* section.

Enable

Setting EN = high and $\overline{\text{EN}}$ = low enables the outputs. Setting EN = low and $\overline{\text{EN}}$ = high forces the outputs to a differential low when disabled. All changes on CLK, SEL, and IN_ are ignored.

Asynchronous Operation

Setting SEL = high and $\overline{\text{SEL}}$ = low enables four channels to operate independently as a buffer/receiver (CLK is ignored). In asynchronous mode, the CLK sig-

nal should be set to either logic low or high state to minimize noise coupling.

Synchronous Operation

Setting SEL = low and $\overline{\text{SEL}}$ = high enables all four channels to operate in synchronous mode. In this mode, buffered inputs are clocked into flip-flops simultaneously on every rising edge of the differential clock input (CLK and $\overline{\text{CLK}}$).

Differential Signal Input Limit

The maximum differential input signal magnitude is 3.0V.

Supply Voltages

For interfacing to differential PECL signals, the VCC range is from +3.0V to +5.5V (with VEE grounded). For interfacing to differential ECL, the VEE range is -3.0V to -5.5V (with VCC grounded). Output levels are referenced to VCC and are considered PECL or ECL, depending on the level of the VCC supply.

Applications Information

Input Bias

Unused inputs should be biased to avoid noise coupling that might cause toggling at the unused outputs. See Figure 2 for the biasing network.

Output Termination

Terminate the outputs through 50Ω to VCC - 3.3V or use an equivalent Thevenin termination. Use identical terminations on each OUT for the lowest skew. When a single-ended signal is taken from a differential output, terminate both outputs. For example, if OUT_ is used as a single-ended output, terminate both OUT_ and $\overline{\text{OUT}}$.

Figure 2. Input Bias Circuits for Unused Pins for MAX9401/MAX9404

Quad ECL/PECL Differential Buffers/Receivers

MAX9401/MAX9404

Figure 3. Input and Output Voltage Definitions

Figure 4. IN to OUT Propagation Delay Timing Diagram

Ensure that the output currents do not exceed the current limits as specified in the *Absolute Maximum Ratings*. Under all operating conditions, the device's total thermal limits should be observed.

Power-Supply Bypassing

Adequate power-supply bypassing is necessary to maximize the performance and noise immunity. Bypass V_{CC} to V_{EE} with high-frequency surface-mount ceramic 0.1 μ F and 0.01 μ F capacitors as close to the device as

possible, with the 0.01 μ F capacitor closest to the device pins. Use multiple bypass vias for connection to minimize inductance.

Circuit Board Traces

Input and output trace characteristics affect the performance of the MAX9401/MAX9404. Connect each of the inputs and outputs to a 50 Ω characteristic impedance trace. Avoid discontinuities in differential impedance and maximize common-mode noise immunity by main-

Quad ECL/PECL Differential Buffers/Receivers

Figure 5. CLK to OUT Propagation Delay Timing Diagram

taining the distance between differential traces and avoid sharp corners. Minimize the number of vias to prevent impedance discontinuities. Reduce reflections by maintaining the 50Ω characteristic impedance through connectors and across cables. Minimize skew by matching the electrical length of the traces.
