

# 3V, $\pm 15\text{kV}$ ESD-Protected, AutoShutdown Plus RS-232 Transceiver for PDAs and Cell Phones

## General Description

The MAX3387E 3V powered TIA/EIA-232 and V.28/V.24 is a communications interface with low power requirements, high data-rate capabilities, and enhanced electrostatic discharge (ESD) protection. The MAX3387E has three receivers and three transmitters. All RS-232 inputs and outputs are protected to  $\pm 15\text{kV}$  using the IEC 1000-4-2 Air-Gap Discharge method,  $\pm 8\text{kV}$  using the IEC 1000-4-2 Contact Discharge method, and  $\pm 15\text{kV}$  using the Human Body Model.

A proprietary low-dropout transmitter output stage enables true RS-232 performance from a +3.0V to +5.5V supply with a dual charge pump. The charge pump requires only four small  $0.1\mu\text{F}$  capacitors for operation from a +3.3V supply. The MAX3387E is capable of running at data rates up to 250kbps while maintaining RS-232 compliant output levels.

The MAX3387E has a unique  $V_L$  pin that allows interoperation in mixed-logic voltage systems. Both input and output logic levels are pin programmable through the  $V_L$  pin. The MAX3387E is available in a space-saving TSSOP package.

## Applications

Subnotebook/Palmtop Computers  
PDAs and PDA Cradles  
Cell Phone Data Cables  
Battery-Powered Equipment  
Hand-Held Equipment  
Peripherals

## Features

- ◆  $V_L$  Pin for Compatibility with Mixed-Voltage Systems
- ◆  $\pm 15\text{kV}$  ESD Protection on Rx Inputs and Tx Outputs
- ◆ Low  $300\mu\text{A}$  Supply Current
- ◆ Guaranteed 250kbps Data Rate
- ◆  $1\mu\text{A}$  AutoShutdown Plus™ with Receivers Active
- ◆ Meets TIA/EIA-232 Specifications Down to 3.0V

## Ordering Information

PART	TEMP. RANGE	PIN-PACKAGE
MAX3387ECUG+	$0^\circ\text{C}$ to $+70^\circ\text{C}$	24 TSSOP
MAX3387EEUG+	$-40^\circ\text{C}$ to $+85^\circ\text{C}$	24 TSSOP

+ Denotes a lead(Pb)-free/RoHS-compliant package.

## Pin Description

PIN	NAME	FUNCTION
1	C1+	Positive Terminal of the Voltage-Doubler Charge-Pump Capacitor
2	V+	+5.5V Supply Generated by the Charge Pump
3	C1-	Negative Terminal of the Voltage-Doubler Charge-Pump Capacitor
4	C2+	Positive Terminal of the Inverting Charge-Pump Capacitor
5	C2-	Negative Terminal of the Inverting Charge-Pump Capacitor
6	V-	-5.5V Generated by the Charge Pump
7	T1IN	TTL/CMOS Transmitter Inputs
8	T2IN	
9	$\overline{\text{INVALID}}$	Output of the Valid Signal Detector. $\overline{\text{INVALID}}$ is high if a valid RS-232 signal is present on the receiver inputs.
10	T3IN	TTL/CMOS Transmitter Inputs
11	FORCEON	Force-On Input. Drive FORCEON high to override automatic circuitry keeping transmitters on (FORCEOFF must be high) (Table 1).
12	R3OUT	TTL/CMOS Receiver Outputs. Swing between 0V and $V_L$ .
13	R2OUT	
14	R1OUT	
15	$V_L$	Logic-Level Supply. All CMOS inputs and outputs are referenced to this supply.
16	R3IN	RS-232 Receiver Inputs
17	R2IN	
18	R1IN	
19	T3OUT	RS-232 Transmitter Outputs
20	T2OUT	
21	T1OUT	
22	GND	Ground
23	VCC	+3.0V to +5.5V Supply Voltage
24	$\overline{\text{FORCEOFF}}$	Force-Off Input. Drive $\overline{\text{FORCEOFF}}$ low to shut down transmitters and on-board power supply. This overrides all automatic circuitry and FORCEON (Table 1).

# 3V, ±15kV ESD-Protected, AutoShutdown Plus RS-232 Transceiver for PDAs and Cell Phones

## Detailed Description

### Dual Charge-Pump Voltage Converter

The MAX3387E's internal power supply consists of a regulated dual charge pump that provides output voltages of +5.5V (doubling charge pump) and -5.5V (inverting charge pump), regardless of the input voltage (VCC) over a +3.0V to +5.5V range. The charge pumps operate in a discontinuous mode: if the output voltages are less than 5.5V, the charge pumps are enabled; if the output voltages exceed 5.5V, the charge pumps are disabled. Each charge pump requires a flying capacitor (C1, C2) and a reservoir capacitor (C3, C4) to generate the V+ and V- supplies.

### RS-232 Transmitters

The transmitters are inverting level translators that convert CMOS-logic levels to 5.0V EIA/TIA-232 levels.

The MAX3387E transmitters guarantee a 250kbps data rate with worst-case loads of 3kΩ in parallel with 1000pF, providing compatibility with PC-to-PC communication software (such as Laplink®). Transmitters can be paralleled to drive multiple receivers or mice. Figure 1 shows a complete system connection.

Figure 1. Interface Under Control of PMU

Laplink is a registered trademark of Laplink Software, Inc.

These RS-232 output stages are turned off (high impedance) when the device is in shutdown mode. When the power is off, the MAX3387E permits the outputs to be driven up to ±12V.

The transmitter inputs do not have pull-up resistors. Connect unused inputs to GND or VL.

### RS-232 Receivers

The receivers convert RS-232 signals to CMOS-logic output levels. The MAX3387E's receivers are always active, even when the device is in shutdown.

The MAX3387E features an  $\overline{\text{INVALID}}$  output that indicates when no signal is present on any RS-232 receiver inputs.  $\overline{\text{INVALID}}$  is independent of other control logic functions; it indicates the receiver input conditions only (Figures 2 and 3).

Figure 2a.  $\overline{\text{INVALID}}$  Function Diagram,  $\overline{\text{INVALID}}$  = Low

Figure 2b.  $\overline{\text{INVALID}}$  Function Diagram,  $\overline{\text{INVALID}}$  = High

Figure 3a. Receiver Thresholds for  $\overline{\text{INVALID}}$

Figure 2d. Power-Down Logic

### AutoShutdown Plus Mode

The MAX3387E achieves a 1µA supply current with Maxim's AutoShutdown Plus feature, which operates when  $\overline{\text{FORCEOFF}}$  is high and a  $\overline{\text{FORCEON}}$  is low. When these devices do not sense a valid signal transition on any receiver and transmitter input for 30sec, the on-board charge pumps are shut down, reducing supply current to 1µA. This occurs if the RS-232 cable is disconnected or if the connected peripheral transmitters are turned off, and if the UART driving the transmitter inputs is inactive. The system turns on again when a valid transition is applied to any RS-232 receiver or transmitter input. As a result, the system saves power without changes to the existing BIOS or operating system.

Figure 3a shows valid and invalid RS-232 receiver voltage levels.  $\overline{\text{INVALID}}$  indicates the receiver input's condition, and is independent of  $\overline{\text{FORCEON}}$  and

$\overline{\text{FORCEOFF}}$  states. Figure 2 and Table 1 summarize the MAX3387E's operating modes.  $\overline{\text{FORCEON}}$  and  $\overline{\text{FORCEOFF}}$  override AutoShutdown Plus circuitry. When neither control is asserted, the IC selects between these states automatically based on the last receiver or transmitter input edge received.

By connecting  $\overline{\text{FORCEON}}$  to  $\overline{\text{INVALID}}$ , the MAX3387E shuts down when no valid receiver level and no receiver or transmitter edge is detected for 30sec, and wakes up when a valid receiver level or receiver or transmitter edge is detected.

By connecting  $\overline{\text{FORCEON}}$  and  $\overline{\text{FORCEOFF}}$  to  $\overline{\text{INVALID}}$ , the MAX3387E shuts down when no valid receiver level is detected.

A mouse or other system with AutoShutdown Plus may need time to wake up. Figure 4 shows a circuit that forces the transmitters on for 100ms, allowing enough time for the other system to realize that the MAX3387E is awake. If the other system outputs valid RS-232 signal transitions within that time, the RS-232 ports on both systems remain enabled.

### V<sub>L</sub> Logic Supply Input

Unlike other RS-232 interface devices where the receiver outputs swing between 0V and V<sub>CC</sub>, the MAX3387E features a separate logic supply input (V<sub>L</sub>) that sets V<sub>OH</sub> for the receiver outputs and sets thresholds for the receiver inputs. This feature allows a great deal of flexibility in interfacing to many different types of systems with different logic levels. Connect this input to the host logic supply (1.8V ≤ V<sub>L</sub> ≤ V<sub>CC</sub>). Also, see the *Typical PDA/Cell-Phone Application* section.

# 3V, ±15kV ESD-Protected, AutoShutdown Plus RS-232 Transceiver for PDAs and Cell Phones

MAX3387E

Figure 3b. AutoShutdown Plus/ $\overline{\text{INVALID}}$  Timing Diagram

Figure 4. AutoShutdown with Initial Turn-On to Wake Up a System

## Software-Controlled Shutdown

If direct software control is desired,  $\overline{\text{INVALID}}$  can be used to indicate a DTR or ring indicator signal. Connect  $\overline{\text{FORCEOFF}}$  and  $\overline{\text{FORCEON}}$  together to bypass AutoShutdown so the line acts like a SHDN input.

## ±15kV ESD Protection

As with all Maxim devices, ESD-protection structures are incorporated on all pins to protect against electrostatic discharges (ESDs) encountered during handling and assembly. The MAX3387E driver outputs and receiver inputs have extra protection against static electricity. Maxim has developed state-of-the-art structures to protect these pins against ESD of ±15kV without damage. The ESD structures withstand high ESD in all states: normal operation, shutdown, and powered down. After an ESD event, Maxim's "E" version devices keep working without latching, whereas competing RS-232 products can latch and must be powered down to remove latching. ESD protection can be tested in various ways. The transmitter outputs and receiver inputs of this product family are characterized for protection to the following limits:

- 1) ±15kV using the Human Body Model
- 2) ±8kV using the Contact-Discharge method specified in IEC 1000-4-2
- 3) ±15kV using IEC 1000-4-2's Air-Gap method

Figure 5a. Human Body ESD Test Model

Figure 5b. Human Body Current Waveform

### ESD Test Conditions

ESD performance depends on a variety of conditions. Contact Maxim for a reliability report that documents test setup, methodology, and results.

### Human Body Model

Figure 5a shows the Human Body Model, and Figure 5b shows the current waveform it generates when discharged into a low impedance. This model consists of a 100pF capacitor charged to the ESD voltage of interest, which is then discharged into the test device through a 1.5kΩ resistor.

# 3V, ±15kV ESD-Protected, AutoShutdown Plus RS-232 Transceiver for PDAs and Cell Phones

MAX3387E

Figure 6a. IEC 1000-4-2 ESD Test Model

## IEC 1000-4-2

The IEC 1000-4-2 standard covers ESD testing and performance of finished equipment; it does not specifically refer to ICs. The MAX3387E helps you design equipment that meets Level 4 (the highest level) of IEC 1000-4-2, without the need for additional ESD-protection components.

The major difference between tests done using the Human Body Model and IEC 1000-4-2 is higher peak current in IEC 1000-4-2 because series resistance is lower in the IEC 1000-4-2 model. Hence, the ESD withstand voltage measured to IEC 1000-4-2 is generally lower than that measured using the Human Body Model. Figure 6a shows the IEC 1000-4-2 model, and Figure 6b shows the current waveform for the ±8kV IEC 1000-4-2 Level 4 ESD Contact Discharge test.

The air-gap test involves approaching the device with a charged probe. The contact-discharge method connects the probe to the device before the probe is energized.

## Machine Model

The Machine Model for ESD tests all pins using a 200pF storage capacitor and zero discharge resistance. Its objective is to emulate the stress caused by contact that occurs with handling and assembly during manufacturing. All pins require this protection during manufacturing, not just RS-232 inputs and outputs. Therefore, after PC board assembly, the Machine Model is less relevant to I/O ports.

## Applications Information

### Capacitor Selection

The capacitor type used for C1–C4 is not critical for proper operation; polarized or nonpolarized capacitors can be used. The charge pump requires 0.1μF capaci-

Figure 6b. IEC 1000-4-2 ESD Generator Current Waveform

## Table 2. Minimum Required Capacitor Values

VCC (V)	C1 (μF)	C2, C3, C4 (μF)
3.0 to 3.6	0.1	0.1
4.5 to 5.5	0.047	0.33
3.0 to 5.5	0.22	1

tors for 3.3V operation. For other supply voltages, see Table 2 for required capacitor values. Do not use values smaller than those listed in Table 2. Increasing the capacitor values (e.g., by a factor of 2) reduces ripple on the transmitter outputs and slightly reduces power consumption. C2, C3, and C4 can be increased without changing C1's value. However, do not increase C1 without also increasing the values of C2, C3, and C4 to maintain the proper ratios (C1 to the other capacitors).

When using the minimum required capacitor values, make sure the capacitor value does not degrade excessively with temperature. If in doubt, use capacitors with a larger nominal value. The capacitor's equivalent series resistance (ESR), which usually rises at low temperatures, influences the amount of ripple on V+ and V-.

# 3V, ±15kV ESD-Protected, AutoShutdown Plus RS-232 Transceiver for PDAs and Cell Phones

## Power-Supply Decoupling

In most circumstances, a 0.1µF bypass capacitor is adequate. In applications that are sensitive to power-supply noise, decouple V<sub>CC</sub> to ground with a capacitor of the same value as charge-pump capacitor C1. Connect bypass capacitors as close to the IC as possible.

Figure 7. Transmitter Outputs when Exiting Shutdown

## Operation Down to 2.7V

Transmitter outputs will meet TIA/EIA-562 levels of ±3.7V with supply voltages as low as +2.7V.

## Transmitter Outputs when Exiting Shutdown

Figure 7 shows two transmitter outputs when exiting shutdown mode. As they become active, the two transmitter outputs are shown going to opposite RS-232 levels (one transmitter input is high; the other is low). Each transmitter is loaded with 3kΩ in parallel with 2500pF. The transmitter outputs display no ringing or undesirable transients as they come out of shutdown. Note that the transmitters are enabled only when the magnitude of V<sub>-</sub> exceeds approximately 3V.

## High Data Rates

The MAX3387E maintains the RS-232 ±5.0V minimum transmitter output voltage even at high data rates. Figure 8 shows a transmitter loopback test circuit. Figure 9 shows a loopback test result at 120kbps, and Figure 10 shows the same test at 250kbps. For Figure 9, all transmitters were driven simultaneously at 120kbps into RS-232 loads in parallel with 1000pF. For Figure 10, a single transmitter was driven at 250kbps, and all transmitters were loaded with an RS-232 receiver in parallel with 1000pF.

## Interconnection with 3V and 5V Logic

The MAX3387E can directly interface with various 5V logic families, including ACT and HCT CMOS. The logic voltage power-supply pin (V<sub>L</sub>) sets the output voltage level of the receivers and the input thresholds of the transmitters.

## Typical PDA/Cell-Phone Application

The MAX3387E is designed with PDA applications in mind. Two transmitters and two receivers handle standard full-duplex communication protocol, while an extra transmitter allows a ring indicator signal to alert the UART on the PC. Without the ring indicator transmitter, solutions for these applications would require software-intensive polling of the cradle inputs.

The ring indicate (RI) signal is generated when a PDA, phone, or other “cradled” device is plugged into its cradle. This generates a logic-low signal to the RI transmitter input, creating +6V at the ring indicate pin. The PC’s UART RI input is the only pin that can generate an interrupt from signals arriving through the RS-232 port. The interrupt routine for this UART will then service the RS-232 full-duplex communication between the PDA and the PC.

As cell phone design becomes more like that of PDAs, cell phones will require similar docking ability and communication protocol. Cell phones operate on a single lithium-ion (Li+) battery and work with a power-supply voltage of +2.7V to +4V. The baseband logic coming from the phone connector can be as low as 1.8V at the transceivers. To prevent forward biasing of a device internal to the cell phone, the MAX3387E comes with a logic power-supply pin ( $V_L$ ) that limits the logic levels presented to the phone. The receiver outputs will sink to zero for low outputs, but will not exceed  $V_L$  for logic highs. The input logic levels for the transmitters are also altered, scaled by the magnitude of the  $V_L$  input. The device will work with  $V_L$  as low as 1.8V before the charge-pump noise will begin to cause the transmitter outputs to oscillate. This is useful with cell phones and other power-efficient devices with core logic voltage levels that go as low as 1.8V.

## Package Information

For the latest package outline information and land patterns, go to [www.maxim-ic.com/packages](http://www.maxim-ic.com/packages). Note that a “+”, “#”, or “-” in the package code indicates RoHS status only. Package drawings may show a different suffix character, but the drawing pertains to the package regardless of RoHS status.

PACKAGE TYPE	PACKAGE CODE	DOCUMENT NO.
24 TSSOP	U24+1	<a href="#">21-0066</a>

# 3V, $\pm 15\text{kV}$ ESD-Protected, AutoShutdown Plus RS-232 Transceiver for PDAs and Cell Phones

## Revision History

REVISION NUMBER	REVISION DATE	DESCRIPTION	PAGES CHANGED
3	6/10	Added Note 2 to the <i>Electrical Characteristics</i> table	4
		Changed the <i>Chip Information</i> section to say "PROCESS: BiCMOS"	13

Maxim cannot assume responsibility for use of any circuitry other than circuitry entirely embodied in a Maxim product. No circuit patent licenses are implied. Maxim reserves the right to change the circuitry and specifications without notice at any time.
