

Features

- Fast access time: 15 ns
- Wide voltage range: 5.0 V ± 10% (4.5 V to 5.5 V)
- Complementary metal oxide semiconductor (CMOS) for optimum speed/power
- Transistor transistor logic (TTL) compatible inputs and outputs
- CY7C194BN is available in 24-pin DIP, 24-pin SOJ packages.

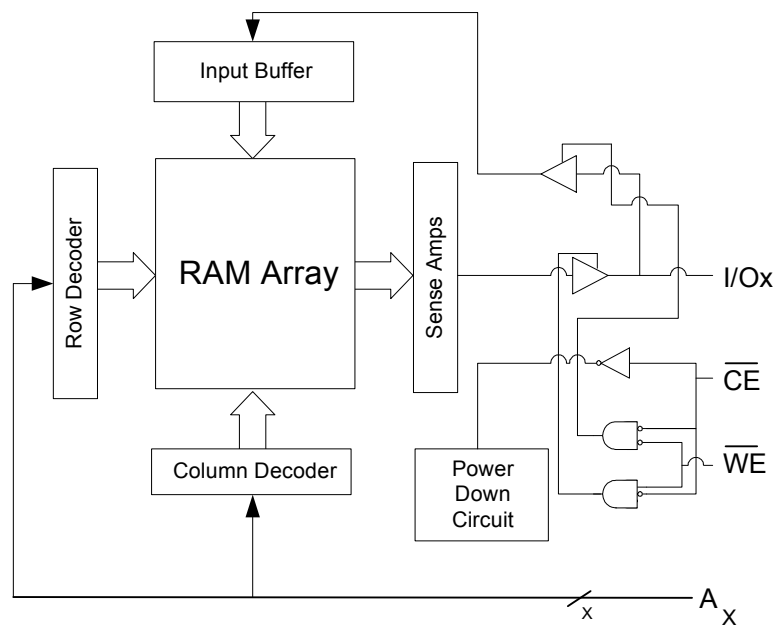

General Description

The CY7C194BN is a high-performance CMOS Asynchronous SRAM organized as 64 K × 4 bits that supports an asynchronous memory interface. The device features an automatic power-down feature that significantly reduces power consumption when deselected.

See the Truth Table in this data sheet for a complete description of read and write modes.

The CY7C194BN is available in 24-pin DIP, 24-pin SOJ package(s).

Notes

- V_{IL}(min) = -2.0 V for pulse durations of less than 20 ns.
- Tested initially and after any design or process change that may affect these parameters
- Test Conditions assume a transition time of 3 ns or less, timing reference levels of 1.5 V, input pulse levels of 0 to 3.0 V.

Timing Waveforms

Figure 1. Read Cycle No. 1 ^[8, 9]

Notes

4. Tested initially and after any design or process change that may affect these parameters
5. At any given temperature and voltage condition, t_{HZCE} is less than t_{LZCE} , and t_{HZWE} is less than t_{LZWE} for any given device.
6. The internal write time of the memory is defined by the overlap of \overline{CE} LOW and \overline{WE} LOW. \overline{CE} and \overline{WE} must be LOW to initiate a write, and the transition of any of these signals can terminate the write. The input data set-up and hold timing should be referenced to the leading edge of the signal that terminates the write.
7. t_{HZCE} , t_{HZWE} are specified as in part (b) of the A/C Test Loads. Transitions are measured ± 200 mV from steady state voltage.
8. Device is continuously selected. $\overline{CE} = V_{IL}$.
9. \overline{WE} is HIGH for Read Cycle.

Timing Waveforms (continued)

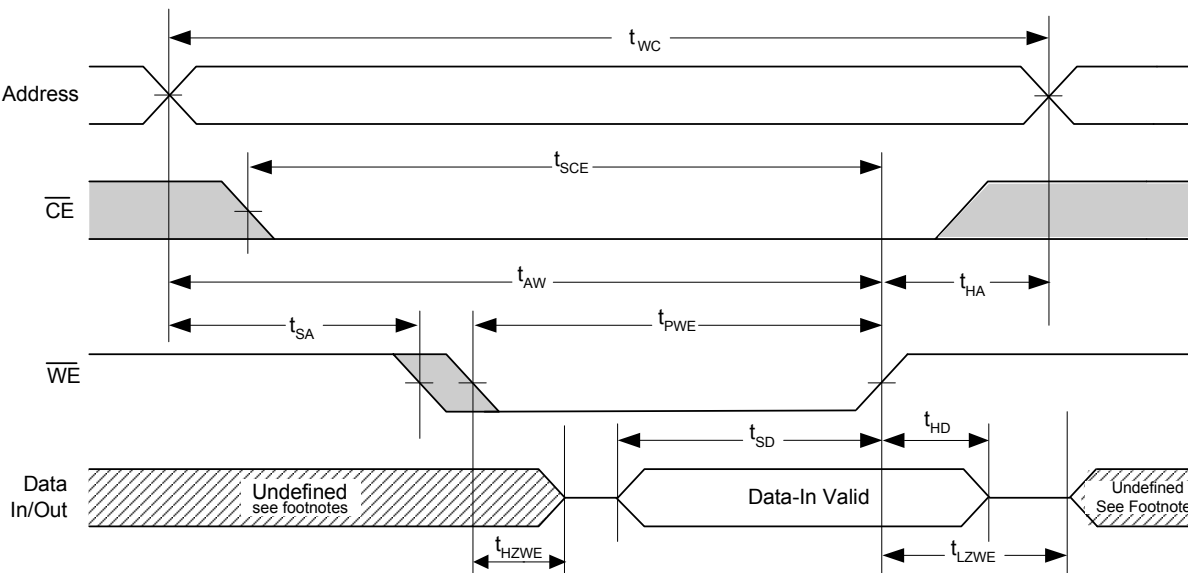

Figure 3. Write Cycle No. 1 (\overline{WE} Controlled) [10, 13]

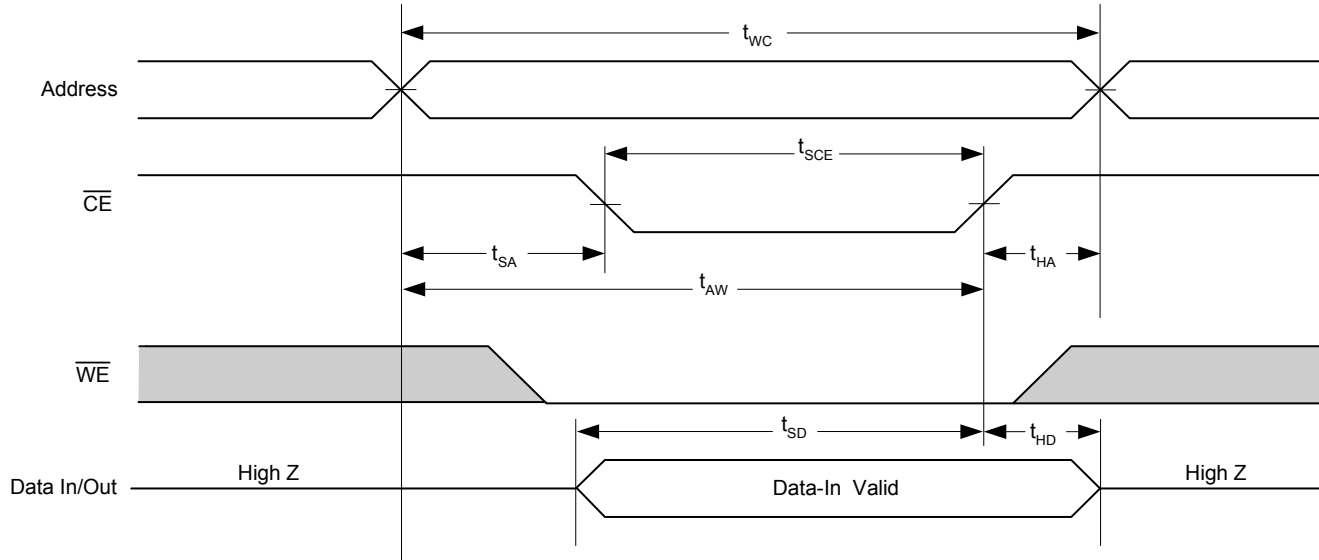

Notes

- 10. Tested initially and after any design or process change that may affect these parameters
- 11. \overline{WE} is HIGH in read cycle.
- 12. Address valid prior to or coincident with \overline{CE} transition LOW.
- 13. The minimum write cycle time is the sum of t_{HZWE} and t_{SD} .

Timing Waveforms (continued)

Figure 4. Write Cycle No. 2 ($\overline{\text{CE}}$ Controlled) [14, 15]

Notes

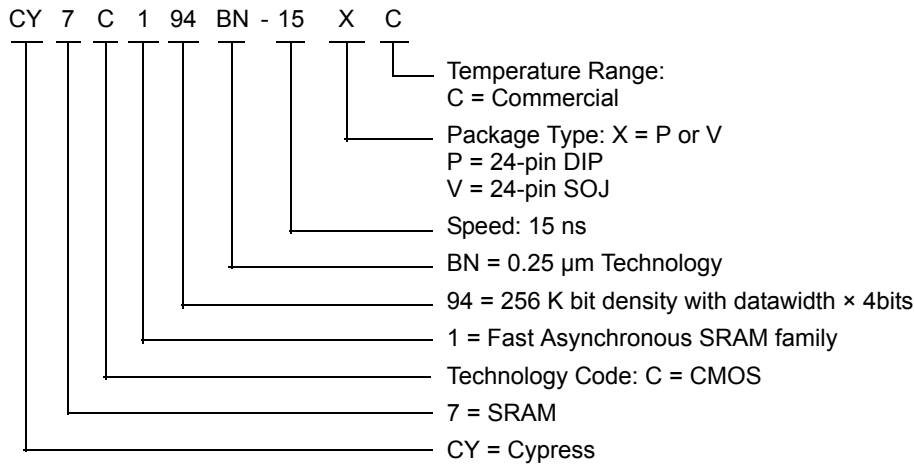

- 14. This cycle is $\overline{\text{CE}}$ controlled.
- 15. If $\overline{\text{CE}}$ goes HIGH simultaneously with $\overline{\text{WE}}$ going HIGH, the output remains in a high-impedance state.
