

**CY7C1441AV25**  
**CY7C1447AV25**

**36-Mbit (1 M × 36/512 K × 72)  
 Flow-Through SRAM**

**Features**

- Supports 133 MHz bus operations
- 1 M × 36/512 K × 72 common I/O
- 2.5 V core power supply
- 2.5 V and 1.8 V I/O power supply
- Fast clock-to-output times
  - 6.5 ns (133 MHz version)
- Provide high performance 2-1-1-1 access rate
- User selectable burst counter supporting Intel® Pentium® interleaved or linear burst sequences
- Separate processor and controller address strobes
- Synchronous self timed write
- Asynchronous output enable
- CY7C1441AV25 available in Pb-free 165-ball FBGA package. CY7C1447AV25 available in non Pb-free 209-ball FBGA package.
- JTAG boundary scan for FBGA package
- ZZ sleep mode option

**Functional Description**

The CY7C1441AV25/CY7C1447AV25 are 2.5 V, 1 M × 36/512 K × 72 Synchronous Flow-Through SRAMs, designed to interface with high speed microprocessors with minimum glue logic. Maximum access delay from clock rise is 6.5 ns (133 MHz version). A 2-bit on-chip counter captures the first address in a burst and increments the address automatically for the rest of the burst access. All synchronous inputs are gated by registers controlled by a positive edge-triggered Clock Input (CLK). The synchronous inputs include all addresses, all data inputs, address pipelining Chip Enable (CE<sub>1</sub>), depth expansion Chip Enables (CE<sub>2</sub> and CE<sub>3</sub>), Burst Control inputs (ADSC, ADSP, and ADV), Write Enables (BW<sub>x</sub> and BWE), and Global Write (GW). Asynchronous inputs include the Output Enable (OE) and the ZZ pin.

The CY7C1441AV25/CY7C1447AV25 allows either interleaved or linear burst sequences, selected by the MODE input pin. A HIGH selects an interleaved burst sequence and a LOW selects a linear burst sequence. Burst accesses can be initiated with the Processor Address Strobe (ADSP) or the cache Controller Address Strobe (ADSC) inputs. Address advancement is controlled by the Address Advancement (ADV) input.

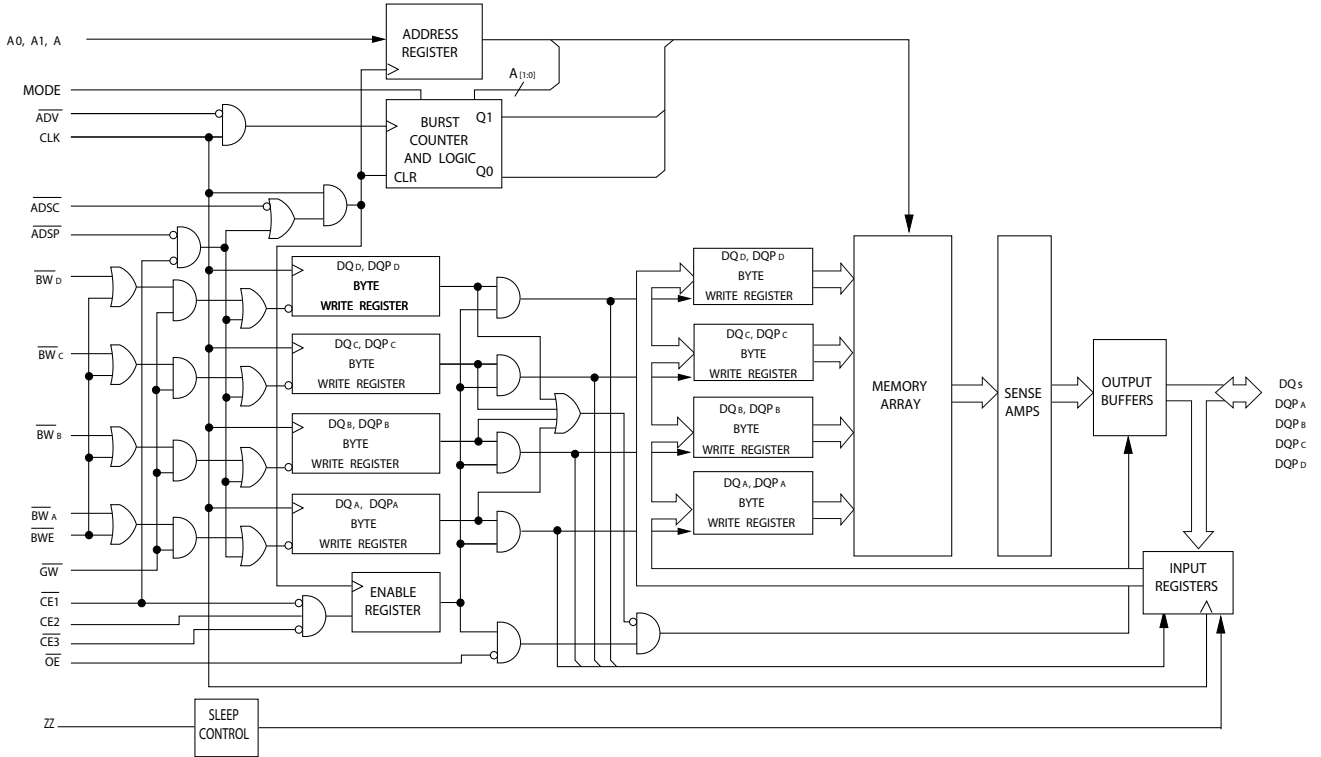

Addresses and chip enables are registered at rising edge of clock when either ADSP or ADSC are active. Subsequent burst addresses can be internally generated as controlled by the ADV.

The CY7C1441AV25/CY7C1447AV25 operates from a +2.5 V core power supply while all outputs may operate with either a +2.5 V or 1.8 V supply. All inputs and outputs are JEDEC-standard JESD8-5 compatible.

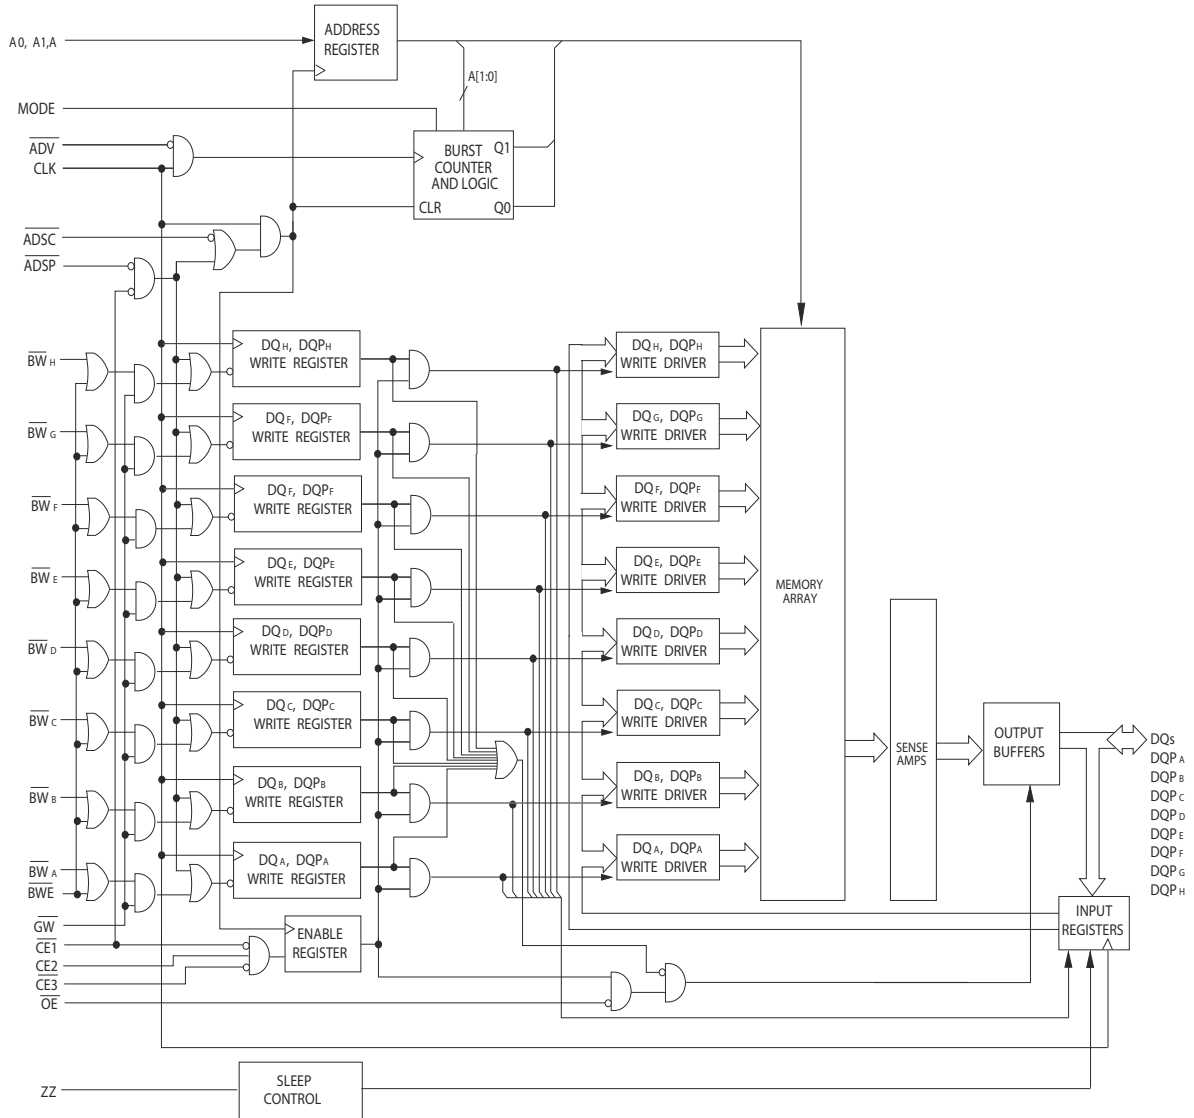

**Selection Guide**

Description	133 MHz	Unit
Maximum Access Time	6.5	ns
Maximum Operating Current	270	mA
Maximum CMOS Standby Current	120	mA

## Pin Definitions

Name	I/O	Description
A <sub>0</sub> , A <sub>1</sub> , A	Input-Synchronous	<b>Address Inputs.</b> Used to select one of the address locations. Sampled at the rising edge of the CLK if ADSP or ADSC is active LOW, and CE <sub>1</sub> , CE <sub>2</sub> , and CE <sub>3</sub> are sampled active. A <sub>[1:0]</sub> feed the 2-bit counter.
BW <sub>A</sub> , BW <sub>B</sub> , BW <sub>C</sub> , BW <sub>D</sub> , BW <sub>E</sub> , BW <sub>F</sub> , BW <sub>G</sub> , BW <sub>H</sub>	Input-Synchronous	<b>Byte Write Select Inputs, Active LOW.</b> Qualified with $\overline{BWE}$ to conduct byte writes to the SRAM. Sampled on the rising edge of CLK.
GW	Input-Synchronous	<b>Global Write Enable Input, Active LOW.</b> When asserted LOW on the rising edge of CLK, a global write is conducted (ALL bytes are written, regardless of the values on BW <sub>X</sub> and BWE).
CLK	Input-Clock	<b>Clock Input.</b> Used to capture all synchronous inputs to the device. Also used to increment the burst counter when $\overline{ADV}$ is asserted LOW during a burst operation.
$\overline{CE_1}$	Input-Synchronous	<b>Chip Enable 1 Input, Active LOW.</b> Sampled on the rising edge of CLK. Used in conjunction with CE <sub>2</sub> and CE <sub>3</sub> to select or deselect the device. ADSP is ignored if CE <sub>1</sub> is HIGH. CE <sub>1</sub> is sampled only when a new external address is loaded.
CE <sub>2</sub>	Input-Synchronous	<b>Chip Enable 2 Input, Active HIGH.</b> Sampled on the rising edge of CLK. Used in conjunction with $\overline{CE_1}$ and $\overline{CE_3}$ to select or deselect the device. CE <sub>2</sub> is sampled only when a new external address is loaded.
$\overline{CE_3}$	Input-Synchronous	<b>Chip Enable 3 Input, Active LOW.</b> Sampled on the rising edge of CLK. Used in conjunction with $\overline{CE_1}$ and CE <sub>2</sub> to select or deselect the device. CE <sub>3</sub> is sampled only when a new external address is loaded.
OE	Input-Asynchronous	<b>Output Enable, Asynchronous Input, Active LOW.</b> Controls the direction of the I/O pins. When LOW, the I/O pins behave as outputs. When deasserted HIGH, I/O pins are tri-stated and act as input data pins. OE is masked during the first clock of a read cycle when emerging from a deselected state.
$\overline{ADV}$	Input-Synchronous	<b>Advance Input Signal.</b> Sampled on the rising edge of CLK. When asserted, it automatically increments the address in a burst cycle.
ADSP	Input-Synchronous	<b>Address Strobe from Processor.</b> Sampled on the rising edge of CLK, active LOW. When asserted LOW, addresses presented to the device are captured in the address registers. A <sub>[1:0]</sub> are also loaded into the burst counter. When ADSP and ADSC are both asserted, only ADSP is recognized. ADSP is ignored when $\overline{CE_1}$ is deasserted HIGH.
ADSC	Input-Synchronous	<b>Address Strobe from Controller.</b> Sampled on the rising edge of CLK, active LOW. When asserted LOW, addresses presented to the device are captured in the address registers. A <sub>[1:0]</sub> are also loaded into the burst counter. When ADSP and ADSC are both asserted, only ADSP is recognized.
$\overline{BWE}$	Input-Synchronous	<b>Byte Write Enable Input, Active LOW.</b> Sampled on the rising edge of CLK. This signal must be asserted LOW to conduct a byte write.
ZZ	Input-Asynchronous	<b>ZZ Sleep Input, Active HIGH.</b> When asserted HIGH places the device in a non time-critical "sleep" condition with data integrity preserved. For normal operation, this pin must be LOW or left floating. ZZ pin has an internal pull down.
DQ <sub>s</sub>	I/O-Synchronous	<b>Bidirectional Data I/O Lines.</b> As inputs, they feed into an on-chip data register that is triggered by the rising edge of CLK. As outputs, they deliver the data contained in the memory location specified by the addresses presented during the previous clock rise of the read cycle. The direction of the pins is controlled by OE. When OE is asserted LOW, the pins behave as outputs. When HIGH, DQ <sub>s</sub> and DQP <sub>X</sub> are placed in a tri-state condition. The outputs are automatically tri-stated during the data portion of a write sequence, during the first clock when emerging from a deselected state, and when the device is deselected, regardless of the state of OE.
DQP <sub>X</sub>	I/O-Synchronous	<b>Bidirectional Data Parity I/O Lines.</b> Functionally, these signals are identical to DQ <sub>s</sub> . During write sequences, DQP <sub>X</sub> is controlled by BW <sub>X</sub> correspondingly.
MODE	Input-Static	<b>Selects Burst Order.</b> When tied to GND selects linear burst sequence. When tied to V <sub>DD</sub> or left floating selects interleaved burst sequence. This is a strap pin and should remain static during device operation. Mode pin has an internal pull up.
V <sub>DD</sub>	Power Supply	<b>Power Supply Inputs to the Core of the Device.</b>
V <sub>DDQ</sub>	I/O Power Supply	<b>Power Supply for I/O Circuitry.</b>

## Pin Definitions (continued)

Name	I/O	Description
V <sub>SS</sub>	Ground	<b>Ground for the Core of the Device.</b>
V <sub>SSQ</sub>	I/O Ground	<b>Ground for I/O Circuitry.</b>
TDO	JTAG Serial Output Synchronous	<b>Serial Data-Out to the JTAG Circuit.</b> Delivers data on the negative edge of TCK. If the JTAG feature is not utilized, this pin should be left unconnected.
TDI	JTAG Serial Input Synchronous	<b>Serial Data-In to the JTAG Circuit.</b> Sampled on the rising edge of TCK. If the JTAG feature is not utilized, this pin can be left floating or connected to V <sub>DD</sub> through a pull up resistor.
TMS	JTAG Serial Input Synchronous	<b>Serial Data-In to the JTAG Circuit.</b> Sampled on the rising edge of TCK. If the JTAG feature is not utilized, this pin can be disconnected or connected to V <sub>DD</sub> .
TCK	JTAG-Clock	<b>Clock Input to the JTAG Circuitry.</b> If the JTAG feature is not utilized, this pin must be connected to V <sub>SS</sub> .
NC	–	<b>No Connects.</b> Not internally connected to the die.
NC/72M, NC/144M, NC/288M, NC/576M, NC/1G	–	<b>No Connects.</b> Not internally connected to the die. NC/72M, NC/144M, NC/288M, NC/576M, and NC/1G are address expansion pins and are not internally connected to the die.

## Functional Overview

All synchronous inputs pass through input registers controlled by the rising edge of the clock. Maximum access delay from the clock rise ( $t_{CDV}$ ) is 6.5 ns (133 MHz device).

The CY7C1441AV25/CY7C1447AV25 supports secondary cache in systems utilizing either a linear or interleaved burst sequence. The interleaved burst order supports Pentium and i486™ processors. The linear burst sequence is suited for processors that utilize a linear burst sequence. The burst order is user selectable and is determined by sampling the MODE input. Accesses are initiated with either ADSP or ADSC. Address advancement through the burst sequence is controlled by the ADV input. A two-bit on-chip wraparound burst counter captures the first address in a burst sequence and automatically increments the address for the rest of the burst access.

Byte write operations are qualified with the Byte Write Enable (BWE) and Byte Write Select (BW<sub>X</sub>) inputs. A Global Write Enable (GW) overrides all byte write inputs and writes data to all four bytes. All writes are simplified with on-chip synchronous self timed write circuitry.

Three synchronous chip selects ( $\overline{CE}_1$ , CE<sub>2</sub>,  $\overline{CE}_3$ ) and an asynchronous output enable (OE) provide for easy bank selection and output tri-state control. ADSP is ignored if  $\overline{CE}_1$  is HIGH.

### Single Read Accesses

A single read access is initiated when the following conditions are satisfied at clock rise: (1)  $\overline{CE}_1$ , CE<sub>2</sub>, and  $\overline{CE}_3$  are all asserted active and (2) ADSP or ADSC is asserted LOW (if the access is initiated by ADSC, the write inputs must be deasserted during this first cycle). The address presented to the address inputs is latched into the address register and the burst counter or control logic and presented to the memory core. If the OE input is

asserted LOW, the requested data is available as the data outputs a maximum to  $t_{CDV}$  after clock rise. ADSP is ignored if  $\overline{CE}_1$  is HIGH.

### Single Write Accesses Initiated by $\overline{ADSP}$

This access is initiated when the following conditions are satisfied at clock rise: (1)  $\overline{CE}_1$ , CE<sub>2</sub>,  $\overline{CE}_3$  are all asserted active and (2) ADSP is asserted LOW. The addresses presented are loaded into the address register and the burst inputs (GW, BWE, and BW<sub>X</sub>) are ignored during this first clock cycle. If the write inputs are asserted active (see Truth Table on page 10 for appropriate states that indicate a write) on the next clock rise, the appropriate data is latched and written into the device. Byte writes are allowed. All I/Os are tri-stated during a byte write. Because this is a common I/O device, the asynchronous OE input signal must be deasserted and the I/Os must be tri-stated prior to the presentation of data to DQs. As a safety precaution, the data lines are tri-stated when a write cycle is detected, regardless of the state of OE.

### Single Write Accesses Initiated by $\overline{ADSC}$

This write access is initiated when the following conditions are satisfied at clock rise: (1) CE<sub>1</sub>, CE<sub>2</sub>, and  $\overline{CE}_3$  are all asserted active, (2) ADSC is asserted LOW, (3) ADSP is deasserted HIGH, and (4) the write input signals (GW, BWE, and BW<sub>X</sub>) indicate a write access. ADSC is ignored if ADSP is active LOW.

The addresses presented are loaded into the address register and the burst counter or control logic and delivered to the memory core. The information presented to DQ<sub>S</sub> is written into the specified address location. Byte writes are allowed. All I/Os are tri-stated when a write is detected, even a byte write. Because this is a common I/O device, the asynchronous OE input signal must be deasserted and the I/Os must be tri-stated prior to the presentation of data to DQs. As a safety precaution,

the data lines are tri-stated when a write cycle is detected, regardless of the state of OE.

### Burst Sequences

The CY7C1441AV25/CY7C1447AV25 provides an on-chip two-bit wraparound burst counter inside the SRAM. The burst counter is fed by  $A_{[1:0]}$ , and can follow either a linear or interleaved burst order. The burst order is determined by the state of the MODE input. A LOW on MODE selects a linear burst sequence. A HIGH on MODE selects an interleaved burst order. Leaving MODE unconnected causes the device to default to a interleaved burst sequence.

### Sleep Mode

The ZZ input pin is an asynchronous input. Asserting ZZ places the SRAM in a power conservation sleep mode. Two clock cycles are required to enter into or exit from this sleep mode. When in this mode, data integrity is guaranteed. Accesses pending when entering the sleep mode are not considered valid nor is the completion of the operation guaranteed. The device must be deselected prior to entering the sleep mode.  $\overline{CE}_1$ ,  $\overline{CE}_2$ ,  $\overline{CE}_3$ ,  $\overline{ADSP}$ , and  $\overline{ADSC}$  must remain inactive for the duration of  $t_{ZZREC}$  after the ZZ input returns LOW.

### Interleaved Burst Address Table

(MODE = Floating or  $V_{DD}$ )

First Address A1:A0	Second Address A1:A0	Third Address A1:A0	Fourth Address A1:A0
00	01	10	11
01	00	11	10
10	11	00	01
11	10	01	00

### Linear Burst Address Table

(MODE = GND)

First Address A1:A0	Second Address A1:A0	Third Address A1:A0	Fourth Address A1:A0
00	01	10	11
01	10	11	00
10	11	00	01
11	00	01	10

### ZZ Mode Electrical Characteristics

Parameter	Description	Test Conditions	Min	Max	Unit
$I_{DDZZ}$	Sleep mode standby current	$ZZ \geq V_{DD} - 0.2 V$	–	100	mA
$t_{ZZS}$	Device operation to ZZ	$ZZ \geq V_{DD} - 0.2 V$	–	$2t_{CYC}$	ns
$t_{ZZREC}$	ZZ recovery time	$ZZ \leq 0.2 V$	$2t_{CYC}$	–	ns
$t_{ZZI}$	ZZ active to sleep current	This parameter is sampled	–	$2t_{CYC}$	ns
$t_{RZZI}$	ZZ Inactive to exit sleep current	This parameter is sampled	0	–	ns

## Truth Table

The truth table for CY7C1441AV25/CY7C1447AV25 follows. [1, 2, 3, 4, 5]

Cycle Description	Address Used	CE <sub>1</sub>	CE <sub>2</sub>	CE <sub>3</sub>	ZZ	ADSP	ADSC	ADV	WRITE	OE	CLK	DQ

### Notes

- X = "Don't Care." H = Logic HIGH, L = Logic LOW.
- WRITE = L when any one or more Byte Write enable signals and  $\overline{BWE} = L$  or  $\overline{GW} = L$ . WRITE = H when all Byte write enable signals,  $\overline{BWE}$ ,  $\overline{GW} = H$ .
- The DQ pins are controlled by the current cycle and the OE signal. OE is asynchronous and is not sampled with the clock.
- The SRAM always initiates a read cycle when ADSP is asserted, regardless of the state of  $\overline{GW}$ ,  $\overline{BWE}$ , or  $\overline{BW}_x$ . Writes may occur only on subsequent clocks after the ADSP or with the assertion of ADSC. As a result, OE must be driven HIGH prior to the start of the write cycle to allow the outputs to tri-state. OE is a don't care for the remainder of the write cycle.
- OE is asynchronous and is not sampled with the clock rise. It is masked internally during write cycles. During a read cycle all data bits are Tri-State when  $\overline{OE}$  is inactive or when the device is deselected, and all data bits behave as output when OE is active (LOW).

### Partial Truth Table for Read/Write

The partial truth table for read/write for CY7C1441AV25 follows. [6, 7]

Function (CY7C1441AV25)	$\overline{GW}$	$\overline{BWE}$	$\overline{BW}_D$	$\overline{BW}_C$	$\overline{BW}_B$	$\overline{BW}_A$
Read	H	H	X	X	X	X
Read	H	L	H	H	H	H
Write Byte A (DQ <sub>A</sub> , DQP <sub>A</sub> )	H	L	H	H	H	L
Write Byte B (DQ <sub>B</sub> , DQP <sub>B</sub> )	H	L	H	H	L	H
Write Bytes A, B (DQ <sub>A</sub> , DQ <sub>B</sub> , DQP <sub>A</sub> , DQP <sub>B</sub> )	H	L	H	H	L	L
Write Byte C (DQ <sub>C</sub> , DQP <sub>C</sub> )	H	L	H	L	H	H
Write Bytes C, A (DQ <sub>C</sub> , DQ <sub>A</sub> , DQP <sub>C</sub> , DQP <sub>A</sub> )	H	L	H	L	H	L
Write Bytes C, B (DQ <sub>C</sub> , DQ <sub>B</sub> , DQP <sub>C</sub> , DQP <sub>B</sub> )	H	L	H	L	L	H
Write Bytes C, B, A (DQ <sub>C</sub> , DQ <sub>B</sub> , DQ <sub>A</sub> , DQP <sub>C</sub> , DQP <sub>B</sub> , DQP <sub>A</sub> )	H	L	H	L	L	L
Write Byte D (DQ <sub>D</sub> , DQP <sub>D</sub> )	H	L	L	H	H	H
Write Bytes D, A (DQ <sub>D</sub> , DQ <sub>A</sub> , DQP <sub>D</sub> , DQP <sub>A</sub> )	H	L	L	H	H	L

Write All Bytes	L	X	X	X	X	X

### Partial Truth Table for Read/Write

The partial truth table for read/write for CY7C1447AV25 follows. [6, 8]

Function (CY7C1447AV25)	$\overline{GW}$	$\overline{BWE}$	$\overline{BW}_x$
Read	H	H	X
Read	H	L	All $\overline{BW} = H$
Write Byte x – (DQ <sub>x</sub> and DQP <sub>x</sub> )	H	L	L
Write All Bytes	H	L	All $\overline{BW} = L$
Write All Bytes	L	X	X

**Notes**

- X = "Don't Care." H = Logic HIGH, L = Logic LOW.
- Table only lists a partial listing of the byte write combinations. Any combination of  $\overline{BW}_x$  is valid. Appropriate write is done based on which byte write is active.
- $\overline{BW}_x$  represents any byte write signal  $\overline{BW}_x$ . To enable any byte write  $\overline{BW}_x$ , a logic LOW signal should be applied at clock rise. Any number of byte writes can be enabled at the same time for any given write.

## IEEE 1149.1 Serial Boundary Scan (JTAG)

The CY7C1441AV25/CY7C1447AV25 incorporates a serial boundary scan test access port (TAP). This part is fully compliant with 1149.1. The TAP operates using JEDEC-standard 2.5 V/1.8V I/O logic level.

The CY7C1441AV25/CY7C1447AV25 contains a TAP controller, instruction register, boundary scan register, bypass register, and ID register.

### Disabling the JTAG Feature

It is possible to operate the SRAM without using the JTAG feature. To disable the TAP controller, TCK must be tied LOW ( $V_{SS}$ ) to prevent clocking of the device. TDI and TMS are internally pulled up and may be unconnected. They may alternately be connected to  $V_{DD}$  through a pull up resistor. TDO must be left unconnected. On power up, the device comes up in a reset state, which does not interfere with the operation of the device.

### Test Access Port (TAP)

#### Test Clock (TCK)

The test clock is used only with the TAP controller. All inputs are captured on the rising edge of TCK. All outputs are driven from the falling edge of TCK.

#### Test Mode Select (TMS)

The TMS input is used to give commands to the TAP controller and is sampled on the rising edge of TCK. This ball can be left unconnected if the TAP is not used. The ball is pulled up internally, resulting in a logic HIGH level.

#### Test Data-In (TDI)

The TDI ball is used to serially input information into the registers and can be connected to the input of any of the registers. The register between TDI and TDO is chosen by the instruction that is loaded into the TAP instruction register. For information on loading the instruction register, see [Tap Controller State Diagram on page 14](#). TDI is internally pulled up and can be unconnected if the TAP is unused in an application. TDI is connected to the most significant bit (MSB) of any register.

#### Test Data-Out (TDO)

The TDO output ball is used to serially clock data out from the registers. The output is active depending on the current state of the TAP state machine (see [Identification Codes on page 18](#)). The output changes on the falling edge of TCK. TDO is connected to the least significant bit (LSB) of any register.

### Performing a TAP Reset

A RESET is performed by forcing TMS HIGH ( $V_{DD}$ ) for five rising edges of TCK. This RESET does not affect the operation of the SRAM and may be performed while the SRAM is operating.

At power up, the TAP is reset internally to ensure that TDO comes up in a High Z state.

### TAP Registers

Registers are connected between the TDI and TDO balls and allow data to be scanned into and out of the SRAM test circuitry.

Only one register can be selected at a time through the instruction register. Data is serially loaded into the TDI ball on the rising edge of TCK. Data is output on the TDO ball on the falling edge of TCK.

#### Instruction Register

Three-bit instructions can be serially loaded into the instruction register. This register is loaded when it is placed between the TDI and TDO balls as shown in the [Tap Controller Block Diagram on page 15](#). On power up, the instruction register is loaded with the IDCODE instruction. It is also loaded with the IDCODE instruction if the controller is placed in a reset state as described in the previous section.

When the TAP controller is in the Capture-IR state, the two least significant bits are loaded with a binary '01' pattern to allow fault isolation of the board level serial test data path.

#### Bypass Register

To save time when serially shifting data through registers, it is sometimes advantageous to skip certain chips. The bypass register is a single-bit register that is placed between the TDI and TDO balls. This allows data to be shifted through the SRAM with minimal delay. The bypass register is set LOW ( $V_{SS}$ ) when the BYPASS instruction is executed.

#### Boundary Scan Register

The boundary scan register is connected to all the input and bidirectional balls on the SRAM.

The boundary scan register is loaded with the contents of the RAM I/O ring when the TAP controller is in the Capture-DR state. It is then placed between the TDI and TDO balls when the controller is moved to the Shift-DR state. The EXTEST, SAMPLE/PRELOAD and SAMPLE Z instructions are used to capture the contents of the I/O ring.

The Boundary Scan Order tables show the order in which the bits are connected. Each bit corresponds to one of the bumps on the SRAM package. The MSB of the register is connected to TDI and the LSB is connected to TDO.

#### Identification (ID) Register

The ID register is loaded with a vendor specific, 32-bit code during the Capture-DR state when the IDCODE command is loaded in the instruction register. The IDCODE is hardwired into the SRAM and can be shifted out when the TAP controller is in the Shift-DR state. The ID register has a vendor code and other information described in the [Identification Register Definitions on page 18](#).

### TAP Instruction Set

#### Overview

Eight different instructions are possible with the three bit instruction register. All combinations are listed in the [Identification Codes on page 18](#). Three of these instructions are listed as RESERVED and should not be used. The other five instructions are described in detail below.

Instructions are loaded into the TAP controller during the Shift-IR state when the instruction register is placed between TDI and TDO. During this state, instructions are shifted through the instruction register through the TDI and TDO balls. To execute

the instruction after it is shifted in, the TAP controller must be moved into the Update-IR state.

#### *IDCODE*

The IDCODE instruction causes a vendor specific, 32-bit code to be loaded into the instruction register. It also places the instruction register between the TDI and TDO balls and allows the IDCODE to be shifted out of the device when the TAP controller enters the Shift-DR state.

The IDCODE instruction is loaded into the instruction register on power up or whenever the TAP controller is given a test logic reset state.

#### *SAMPLE Z*

The SAMPLE Z instruction causes the boundary scan register to be connected between the TDI and TDO pins when the TAP controller is in a Shift-DR state. The SAMPLE Z command puts the output bus into a High Z state until the next command is given during the "Update IR" state.

#### *SAMPLE/PRELOAD*

SAMPLE/PRELOAD is a 1149.1 mandatory instruction. When the SAMPLE/PRELOAD instructions are loaded into the instruction register and the TAP controller is in the Capture-DR state, a snapshot of data on the inputs and output pins is captured in the boundary scan register.

The user must be aware that the TAP controller clock can only operate at a frequency up to 20 MHz, while the SRAM clock operates more than an order of magnitude faster. Because there is a large difference in the clock frequencies, it is possible that during the Capture-DR state, an input or output may undergo a transition. The TAP may then try to capture a signal while in transition (metastable state). This does not harm the device, but there is no guarantee as to the value that is captured. Repeatable results may not be possible.

To guarantee that the boundary scan register captures the correct value of a signal, the SRAM signal must be stabilized long enough to meet the TAP controller's capture setup plus hold times ( $t_{CS}$  and  $t_{CH}$ ). The SRAM clock input might not be captured correctly if there is no way in a design to stop (or slow) the clock during a SAMPLE/PRELOAD instruction. If this is an issue, it is still possible to capture all other signals and simply ignore the value of the CK and  $\overline{CK}$  captured in the boundary scan register.

When the data is captured, it is possible to shift out the data by putting the TAP into the Shift-DR state. This places the boundary scan register between the TDI and TDO pins.

PRELOAD allows an initial data pattern to be placed at the latched parallel outputs of the boundary scan register cells prior to the selection of another boundary scan test operation.

The shifting of data for the SAMPLE and PRELOAD phases can occur concurrently when required – that is, while data captured is shifted out, the preloaded data can be shifted in.

#### *BYPASS*

When the BYPASS instruction is loaded in the instruction register and the TAP is placed in a Shift-DR state, the bypass register is placed between the TDI and TDO pins. The advantage of the BYPASS instruction is that it shortens the boundary scan path when multiple devices are connected together on a board.

#### *EXTEST*

The EXTEST instruction enables the preloaded data to be driven out through the system output pins. This instruction also selects the boundary scan register to be connected for serial access between the TDI and TDO in the Shift-DR controller state.

#### *EXTEST OUTPUT BUS TRI-STATE*

IEEE Standard 1149.1 mandates that the TAP controller be able to put the output bus into a tri-state mode.

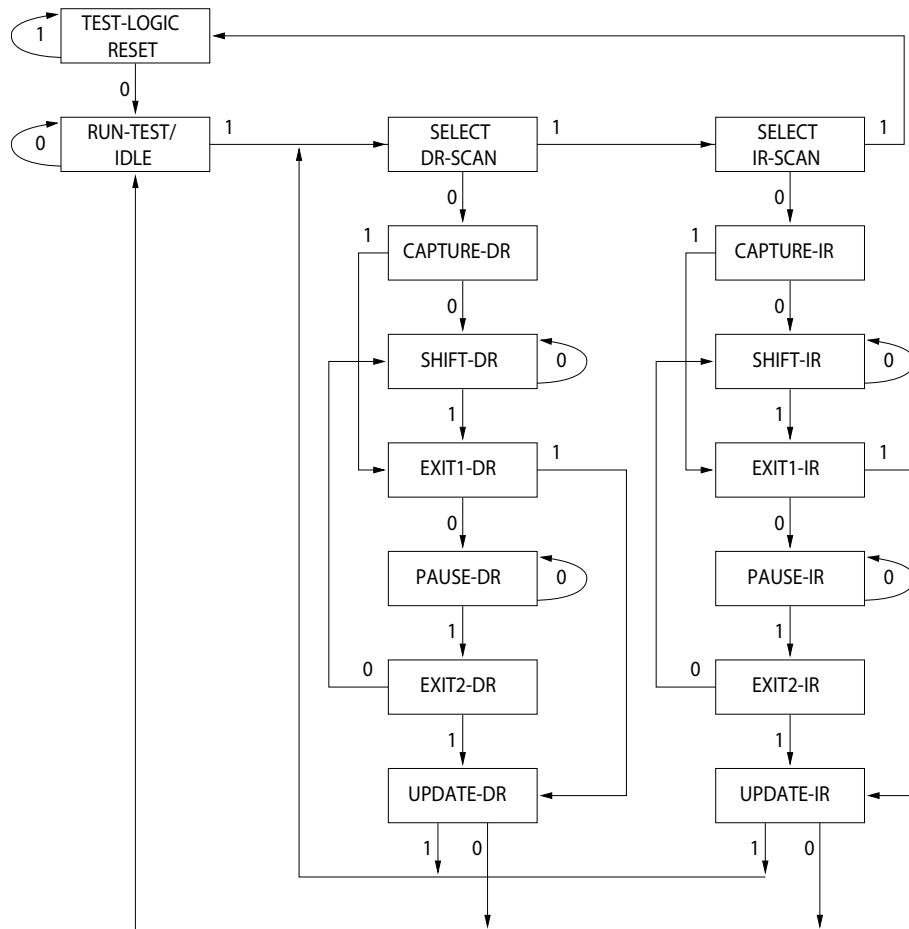

The boundary scan register has a special bit located at bit #138 (for 209-ball FBGA package). When this scan cell, called the "extest output bus tri-state", is latched into the preload register during the Update-DR state in the TAP controller, it directly controls the state of the output (Q-bus) pins when the EXTEST is entered as the current instruction. When HIGH, it enables the output buffers to drive the output bus. When LOW, this bit places the output bus into a High Z condition.

This bit can be set by entering the SAMPLE/PRELOAD, or EXTEST command and then shifting the desired bit into that cell during the Shift-DR state. During Update-DR, the value loaded into that shift register cell latches into the preload register. When the EXTEST instruction is entered, this bit directly controls the output Q-bus pins. Note that this bit is preset HIGH to enable the output when the device is powered up and also when the TAP controller is in the Test-Logic-Reset" state.

#### *Reserved*

These instructions are not implemented but are reserved for future use. Do not use these instructions.

### TAP Controller State Diagram

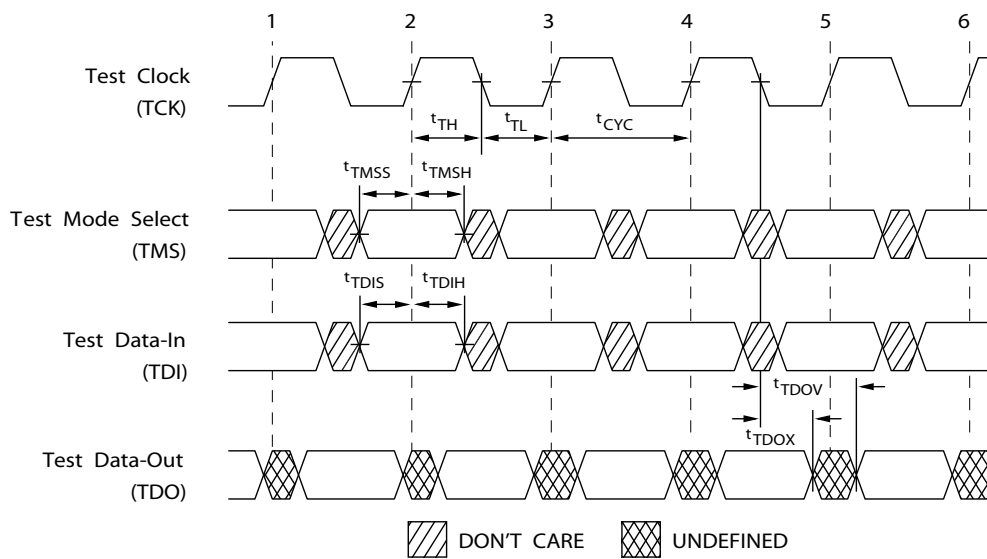

The 0/1 next to each state represents the value of TMS at the rising edge of TCK.

## Identification Register Definitions

Instruction Field	Bit Configuration CY7C1441AV25 (1 M × 36)	Bit Configuration CY7C1447AV25 (512 K × 72)	Description
Revision Number (31:29)	000	000	Describes the version number.
Device Depth (28:24)	01011	01011	Reserved for internal use.
Architecture and Memory Type (23:18)	000001	000001	Defines memory type and architecture.
Bus Width and Density (17:12)	100111	110111	Defines width and density.
Cypress JEDEC ID Code (11:1)	00000110100	00000110100	Allows unique identification of SRAM vendor.
ID Register Presence Indicator (0)	1	1	Indicates the presence of an ID register.

## Scan Register Sizes

Register Name	Bit Size (× 36)	Bit Size (× 72)
Instruction Bypass	3	3
Bypass	1	1
ID	32	32
Boundary Scan Order (165-ball FBGA package)	89	–
Boundary Scan Order (209-ball FBGA package)	–	138

## Identification Codes

Instruction	Code	Description
EXTEST	000	Captures I/O ring contents.
IDCODE	001	Loads the ID register with the vendor ID code and places the register between TDI and TDO. This operation does not affect SRAM operations.
SAMPLE Z	010	Captures I/O ring contents. Places the boundary scan register between TDI and TDO. Forces all SRAM output drivers to a High Z state.
RESERVED	011	Do Not Use: This instruction is reserved for future use.
SAMPLE/PRELOAD	100	Captures I/O ring contents. Places the boundary scan register between TDI and TDO. Does not affect SRAM operation.
RESERVED	101	Do Not Use: This instruction is reserved for future use.
RESERVED	110	Do Not Use: This instruction is reserved for future use.
BYPASS	111	Places the bypass register between TDI and TDO. This operation does not affect SRAM operations.

## Maximum Ratings

Exceeding maximum ratings may impair the useful life of the device. These user guidelines are not tested.

Storage Temperature ..... -65 °C to +150 °C  
 Ambient Temperature with Power Applied ..... -55 °C to +125 °C  
 Supply Voltage on V<sub>DD</sub> Relative to GND ..... -0.3 V to +3.6 V  
 Supply Voltage on V<sub>DDQ</sub> Relative to GND ..... -0.3 V to +V<sub>DD</sub>  
 DC Voltage Applied to Outputs in Tri-State ..... -0.5 V to V<sub>DDQ</sub> + 0.5 V

DC Input Voltage ..... -0.5 V to V<sub>DD</sub> + 0.5 V  
 Current into Outputs (LOW) ..... 20 mA  
 Static Discharge Voltage (per MIL-STD-883, Method 3015) ..... > 2001 V  
 Latch Up Current ..... > 200 mA

## Operating Range

Range	Ambient Temperature	V <sub>DD</sub>	V <sub>DDQ</sub>
Industrial	-40 °C to +85 °C	2.5 V ± 5%	1.7 V to V <sub>DD</sub>

## Electrical Characteristics

Over the Operating Range

Parameter <sup>[16, 17]</sup>	Description	Test Conditions	Min	Max	Unit
V <sub>DD</sub>	Power Supply Voltage		2.375	2.625	V
V <sub>DDQ</sub>	I/O Supply Voltage	for 2.5 V I/O	2.375	2.625	V
		for 1.8 V I/O	1.7	1.9	V
V <sub>OH</sub>	Output HIGH Voltage	for 2.5 V I/O, I <sub>OH</sub> = -1.0 mA	2.0	-	V
		for 1.8 V I/O, I <sub>OH</sub> = -100 μA	1.6	-	V
V <sub>OL</sub>	Output LOW Voltage	for 2.5 V I/O, I <sub>OL</sub> = 1.0 mA	-	0.4	V
		for 1.8 V I/O, I <sub>OL</sub> = 100 μA	-	0.2	V
V <sub>IH</sub>	Input HIGH Voltage <sup>[16]</sup>	for 2.5 V I/O	1.7	V <sub>DD</sub> + 0.3 V	V
		for 1.8 V I/O	1.26	V <sub>DD</sub> + 0.3 V	V
V <sub>IL</sub>	Input LOW Voltage <sup>[16]</sup>	for 2.5 V I/O	-0.3	0.7	V
		for 1.8 V I/O	-0.3	0.36	V
I <sub>X</sub>	Input Leakage Current except ZZ and MODE	GND ≤ V <sub>I</sub> ≤ V <sub>DDQ</sub>	-5	5	μA
	Input Current of MODE	Input = V <sub>SS</sub>	-30	-	μA
		Input = V <sub>DD</sub>	-	5	μA
	Input Current of ZZ	Input = V <sub>SS</sub>	-5	-	μA
Input = V <sub>DD</sub>		-	30	μA	
I <sub>OZ</sub>	Output Leakage Current	GND ≤ V <sub>I</sub> ≤ V <sub>DDQ</sub> , Output Disabled	-5	5	μA
I <sub>DD</sub>	V <sub>DD</sub> Operating Supply Current	V <sub>DD</sub> = Max, I <sub>OUT</sub> = 0 mA, f = f <sub>MAX</sub> = 1/t <sub>CYC</sub>	-	270	mA
I <sub>SB1</sub>	Automatic CE Power Down Current – TTL Inputs	Max V <sub>DD</sub> , Device Deselected, V <sub>IN</sub> ≥ V <sub>IH</sub> or V <sub>IN</sub> ≤ V <sub>IL</sub> , f = f <sub>MAX</sub> , Inputs Switching	-	150	mA
I <sub>SB2</sub>	Automatic CE Power Down Current – CMOS Inputs	Max V <sub>DD</sub> , Device Deselected, V <sub>IN</sub> ≥ V <sub>DD</sub> - 0.3 V or V <sub>IN</sub> ≤ 0.3 V, f = 0, Inputs Static	-	120	mA
I <sub>SB3</sub>	Automatic CE Power Down Current – CMOS Inputs	Max V <sub>DD</sub> , Device Deselected, V <sub>IN</sub> ≥ V <sub>DDQ</sub> - 0.3 V or V <sub>IN</sub> ≤ 0.3 V, f = f <sub>MAX</sub> , Inputs Switching	-	150	mA
I <sub>SB4</sub>	Automatic CE Power Down Current – TTL Inputs	Max V <sub>DD</sub> , Device Deselected, V <sub>IN</sub> ≥ V <sub>DD</sub> - 0.3 V or V <sub>IN</sub> ≤ 0.3 V, f = 0, Inputs Static	-	135	mA

### Notes

16. Overshoot: V<sub>IH(AC)</sub> < V<sub>DD</sub> + 1.5 V (Pulse width less than t<sub>CYC</sub>/2), undershoot: V<sub>IL(AC)</sub> > -2 V (Pulse width less than t<sub>CYC</sub>/2).  
 17. T<sub>Power-up</sub>: Assumes a linear ramp from V to V<sub>DD(min)</sub> within 200 ms. During this time V<sub>IH</sub> < V<sub>DD</sub> and V<sub>DDQ</sub> ≤ V<sub>DD</sub>.

## Capacitance

Parameter <sup>[18]</sup>	Description	Test Conditions	165-ball FBGA Max	209-ball FBGA Max	Unit
$C_{IN}$	Input capacitance	$T_A = 25\text{ }^\circ\text{C}$ , $f = 1\text{ MHz}$ , $V_{DD} = 3.3\text{ V}$ , $V_{DDQ} = 2.5\text{ V}$	7	5	pF
$C_{CLK}$	Clock input capacitance		7	5	pF
$C_{I/O}$	Input/Output capacitance		6	7	pF

## Thermal Resistance

Parameter <sup>[18]</sup>	Description	Test Conditions	165-ball FBGA Package	209-ball FBGA Package	Unit
$\Theta_{JA}$	Thermal resistance (junction to ambient)	Test conditions follow standard test methods and procedures for measuring thermal impedance, per EIA/JESD51.	20.8	25.31	$^\circ\text{C/W}$
$\Theta_{JC}$	Thermal resistance (junction to case)		3.2	4.48	$^\circ\text{C/W}$

## AC Test Loads and Waveforms

Figure 4. AC Test Loads and Waveforms

### 3.3 V I/O Test Load

### 2.5 V I/O Test Load

**Note**

18. Tested initially and after any design or process change that may affect these parameters.

## Switching Characteristics

Over the Operating Range

Parameter <sup>[19, 20]</sup>	Description	-133		Unit
		Min	Max	
$t_{POWER}$	$V_{DD}(\text{typical})$ to the first access <sup>[21]</sup>	1	–	ms
<b>Clock</b>				
$t_{CYC}$	Clock cycle time	7.5	–	ns
$t_{CH}$	Clock HIGH	2.5	–	ns
$t_{CL}$	Clock LOW	2.5	–	ns
<b>Output Times</b>				
$t_{CDV}$	Data output valid after CLK rise	–	6.5	ns
$t_{DOH}$	Data output hold after CLK rise	2.5	–	ns
$t_{CLZ}$	Clock to low Z <sup>[22, 23, 24]</sup>	2.5	–	ns
$t_{CHZ}$	Clock to high Z <sup>[22, 23, 24]</sup>	–	3.8	ns
$t_{OEV}$	$\overline{OE}$ LOW to output valid	–	3.0	ns
$t_{OELZ}$	$\overline{OE}$ LOW to output low Z <sup>[22, 23, 24]</sup>	0	–	ns
$t_{OEZH}$	$\overline{OE}$ HIGH to output high Z <sup>[22, 23, 24]</sup>	–	3.0	ns
<b>Setup Times</b>				
$t_{AS}$	Address setup before CLK rise	1.5	–	ns
$t_{ADS}$	$\overline{ADSP}$ , $\overline{ADSC}$ setup before CLK rise	1.5	–	ns
$t_{ADVS}$	$\overline{ADV}$ setup before CLK rise	1.5	–	ns
$t_{WES}$	$\overline{GW}$ , $\overline{BWE}$ , $\overline{BW}_X$ setup before CLK rise	1.5	–	ns
$t_{DS}$	Data input setup before CLK rise	1.5	–	ns
$t_{CES}$	Chip enable setup	1.5	–	ns
<b>Hold Times</b>				
$t_{AH}$	Address hold after CLK rise	0.5	–	ns
$t_{ADH}$	$\overline{ADSP}$ , $\overline{ADSC}$ hold after CLK rise	0.5	–	ns
$t_{WEH}$	$\overline{GW}$ , $\overline{BWE}$ , $\overline{BW}_X$ hold after CLK rise	0.5	–	ns
$t_{ADVH}$	$\overline{ADV}$ hold after CLK rise	0.5	–	ns
$t_{DH}$	Data input hold after CLK rise	0.5	–	ns
$t_{CEH}$	Chip enable hold after CLK rise	0.5	–	ns

### Notes

19. Timing reference level is 1.25 V when  $V_{DDQ} = 2.5$  V and 0.9 V when  $V_{DDQ} = 1.8$  V.

20. Test conditions shown in (a) of [Figure 4 on page 22](#) unless otherwise noted.

21. This part has a voltage regulator internally;  $t_{POWER}$  is the time that the power needs to be supplied above  $V_{DD(\text{minimum})}$  initially, before a read or write operation can be initiated.

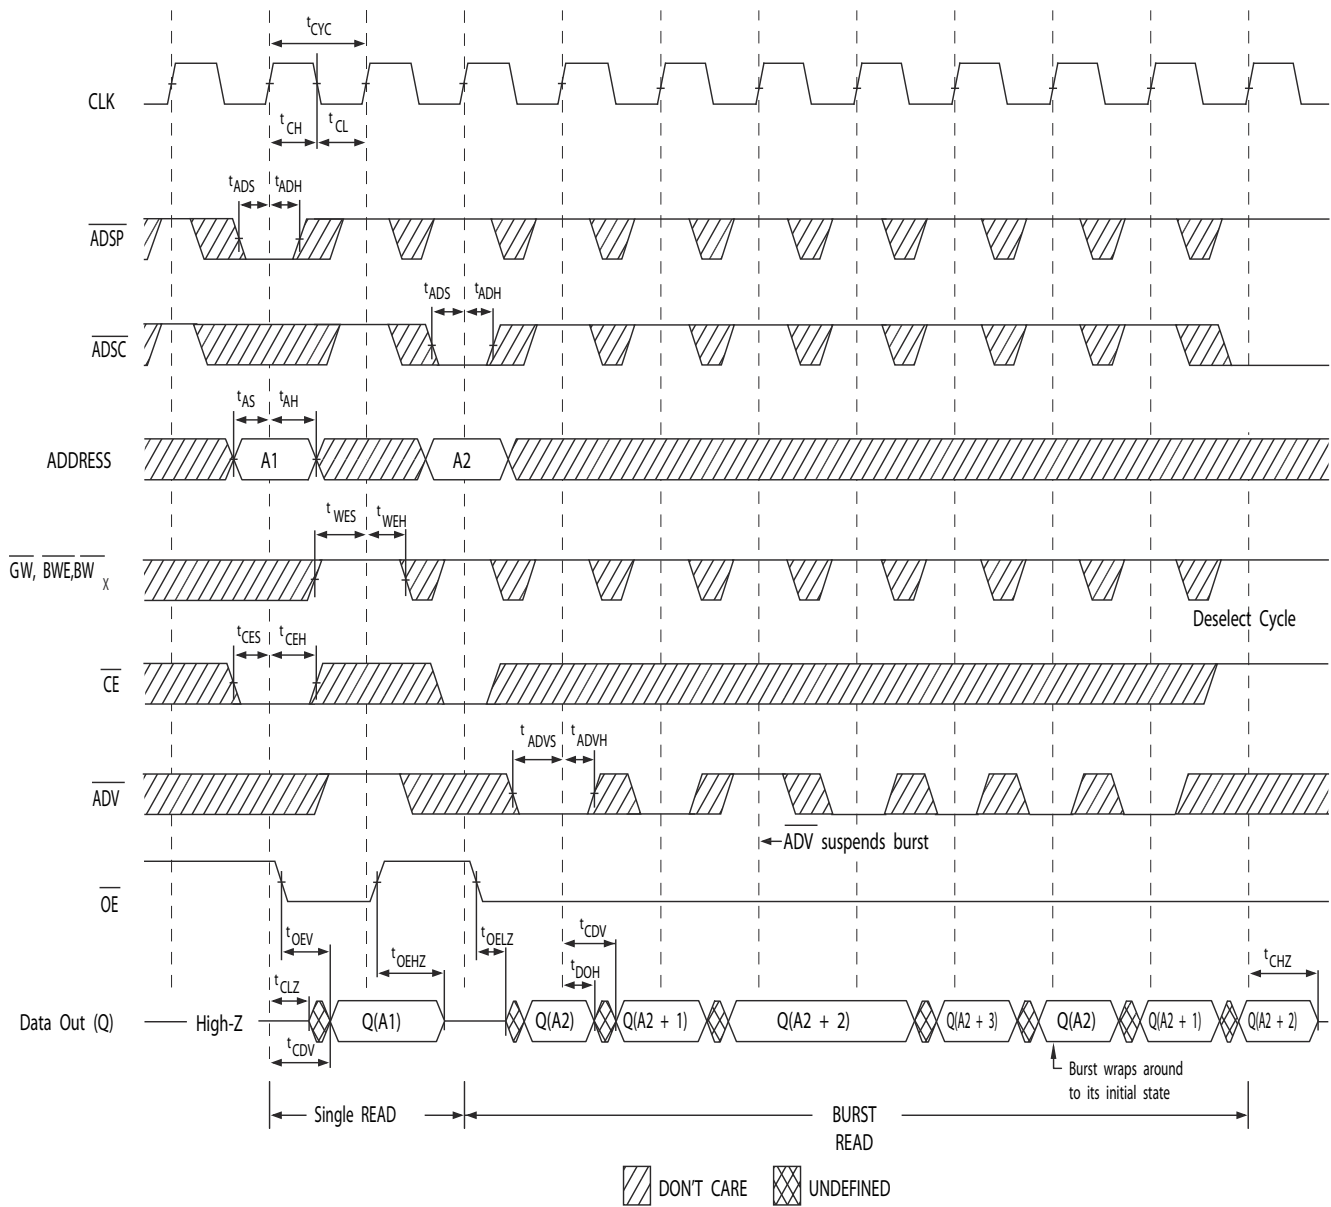

22.  $t_{CHZ}$ ,  $t_{CLZ}$ ,  $t_{OELZ}$ , and  $t_{OEZH}$  are specified with AC test conditions shown in part (b) of [Figure 4 on page 22](#). Transition is measured  $\pm 200$  mV from steady-state voltage.

23. At any given voltage and temperature,  $t_{OEZH}$  is less than  $t_{OELZ}$  and  $t_{CHZ}$  is less than  $t_{CLZ}$  to eliminate bus contention between SRAMs when sharing the same data bus. These specifications do not imply a bus contention condition, but reflect parameters guaranteed over worst case user conditions. Device is designed to achieve High Z prior to Low Z under the same system conditions.

24. This parameter is sampled and not 100% tested.

## Timing Diagrams

Figure 5. Read Cycle Timing [25]

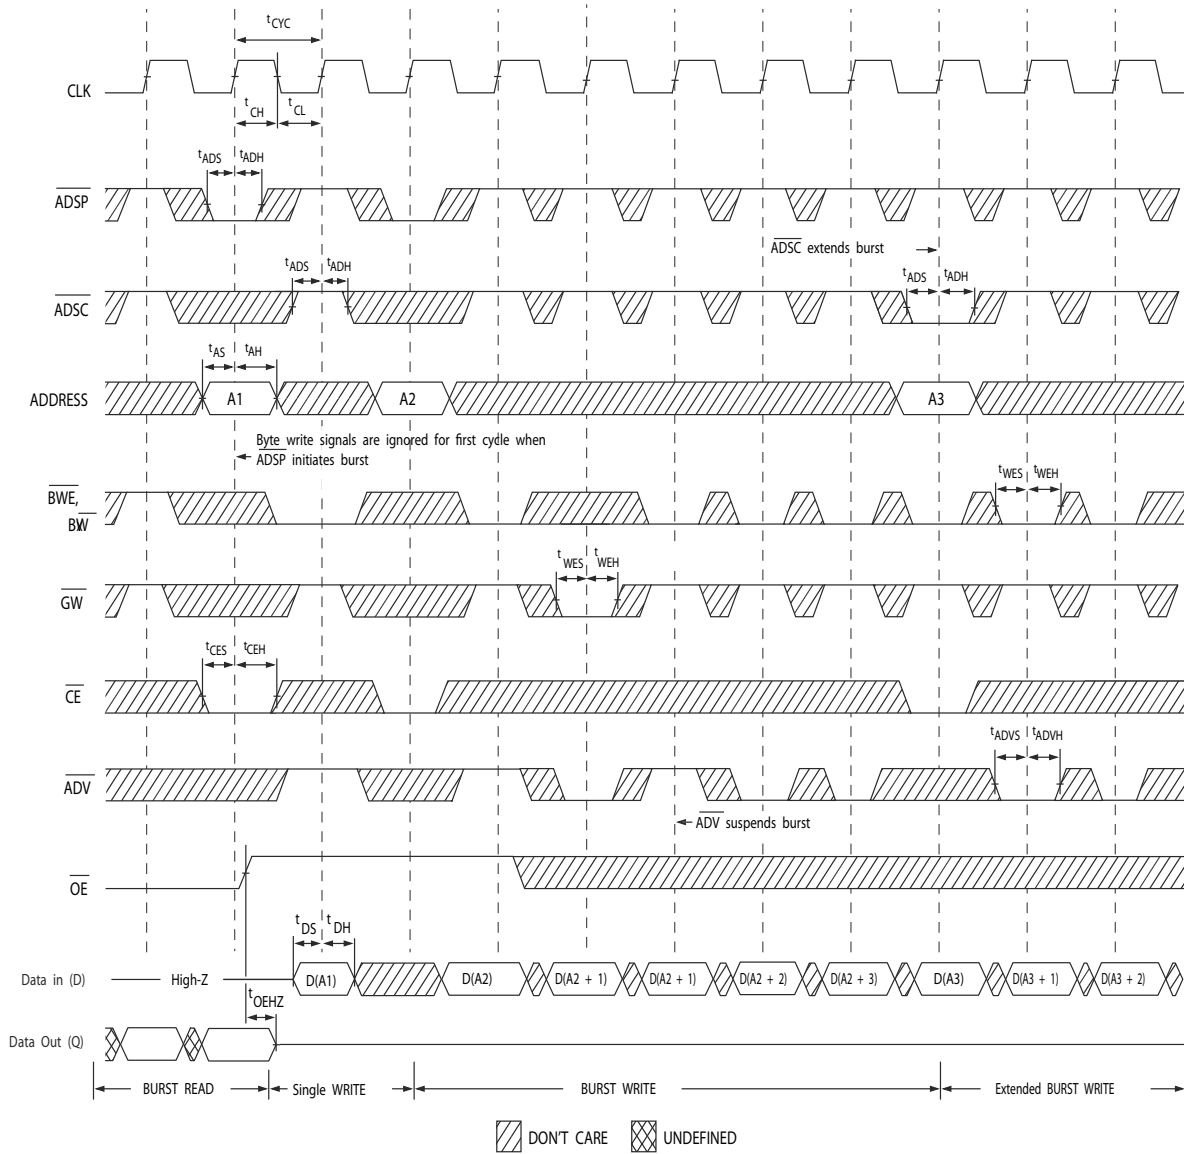

**Note**

25. In this diagram, when  $\overline{CE}$  is LOW:  $\overline{CE}_1$  is LOW,  $CE_2$  is HIGH, and  $\overline{CE}_3$  is LOW. When  $\overline{CE}$  is HIGH:  $\overline{CE}_1$  is HIGH or  $CE_2$  is LOW or  $\overline{CE}_3$  is HIGH.

**Timing Diagrams** (continued)

**Figure 6. Write Cycle Timing** [26, 27]

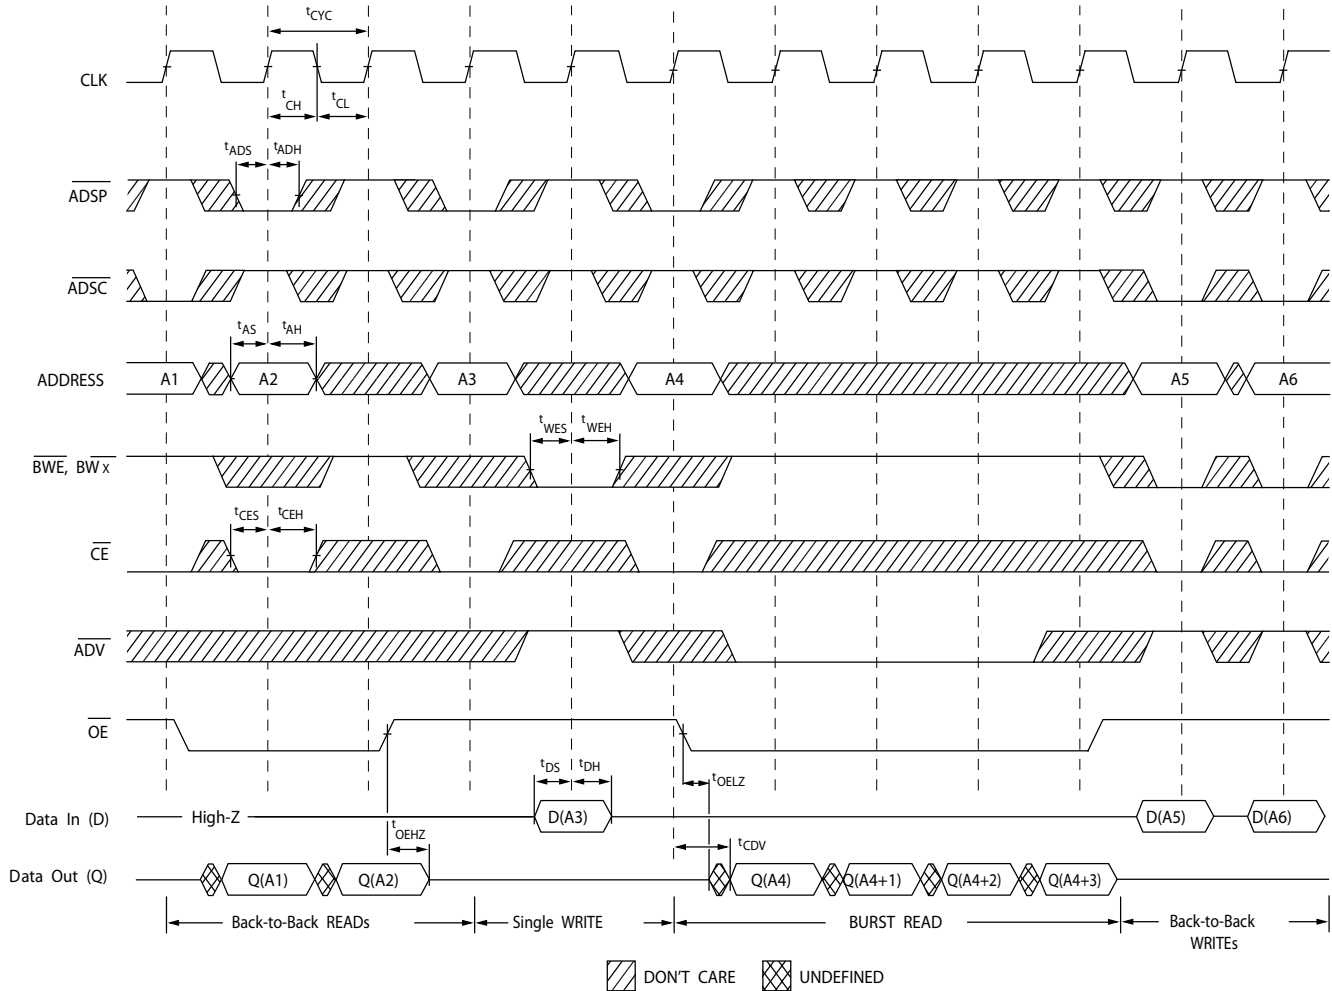

**Notes**

- 26. In this diagram, when  $\overline{CE}$  is LOW:  $\overline{CE}_1$  is LOW,  $CE_2$  is HIGH, and  $\overline{CE}_3$  is LOW. When  $\overline{CE}$  is HIGH:  $\overline{CE}_1$  is HIGH or  $CE_2$  is LOW or  $\overline{CE}_3$  is HIGH.
- 27. Full width write is initiated by either  $\overline{GW}$  LOW; or by  $\overline{GW}$  HIGH,  $\overline{BWE}$  LOW, and  $\overline{BW}_X$  LOW.

**Timing Diagrams** (continued)

**Figure 7. Read/Write Cycle Timing** [28, 29, 30]

**Notes**

- 28. In this diagram, when  $\overline{CE}$  is LOW:  $\overline{CE}_1$  is LOW,  $CE_2$  is HIGH, and  $\overline{CE}_3$  is LOW. When  $\overline{CE}$  is HIGH:  $\overline{CE}_1$  is HIGH or  $CE_2$  is LOW or  $\overline{CE}_3$  is HIGH.
- 29. The data bus (Q) remains in high Z following a WRITE cycle, unless a new read access is initiated by  $\overline{ADSP}$  or  $\overline{ADSC}$ .
- 30.  $\overline{GW}$  is HIGH.

**Timing Diagrams** (continued)

**Figure 8. ZZ Mode Timing** [31, 32]

**Notes**

- 31. Device must be deselected when entering ZZ mode. See [Truth Table on page 10](#) for all possible signal conditions to deselect the device.
- 32. DQs are in high Z when exiting ZZ sleep mode.

### Ordering Information

Not all of the speed, package, and temperature ranges are available. Contact your local sales representative or visit [www.cypress.com](http://www.cypress.com) for actual products offered.

Speed (MHz)	Ordering Code	Package Diagram	Part and Package Type	Operating Range
133	CY7C1441AV25-133BZXI	51-85165	165-ball FBGA (15 × 17 × 1.4 mm) Pb-free	Industrial
	CY7C1447AV25-133BGI	51-85167	209-ball FBGA (14 × 22 × 1.76 mm)

## Acronyms

Acronym	Description
CE	chip enable
CMOS	complementary metal oxide semiconductor
EIA	electronic industries alliance
FBGA	fine-pitch ball grid array
I/O	input/output
JEDEC	joint electron devices engineering council
JTAG	joint test action group
$\overline{OE}$	output enable
SRAM	static random access memory
TAP	test access port
TCK	test clock
TDI	test data-in
TDO	test data-out
TMS	test mode select
TTL	transistor-transistor logic

## Document Conventions

### Units of Measure

Symbol	Unit of Measure
°C	degree Celsius
MHz	megahertz
μA	microampere
mA	milliampere
mm	millimeter
ms	millisecond
mV	millivolt
ns	nanosecond
Ω	ohm
%	percent
pF	picofarad
V	volt
W	watt
